Fujitsu AN-007 (8pp)

12 **"Gate Array and Custom VLSIC Fabrication with the M²CMOS Process"**
(M²CMOS)
Discusses the development of a bulk CMOS N-well process, containing a single level of polysilicon and two layers of metal, for the fabrication of gate arrays.
National Semiconductor AN-321 (6pp)

13 **"HE2000 Gate Array: Packaging and Thermal Considerations"**
(HE2000)
Explains how to calculate the Thermal resistance from the transistor junctions of the HE2000 gate array to the bottom of its 173-pin package. Also discusses heat sink, mounting, and air flow considerations.
Honeywell HE2000 AN-2 (4pp)

14 **"HE2000 Gate Array: Understanding CML Logic"**
(HE2000)
Describes the notational symbology for the CML high-speed, low-power ECL logic used in the HE2000 gate array, illustrating a CML inverter, latch, OR/NOR gate, AND/NAND gate, and Exclusive OR gate.
Honeywell HE2000 AN-1 (2pp)

15 **"HT5000 Gate Array: System Cost Analysis"**
(HT5000)
Shows how manufacturing cost savings and design time reduction can be achieved by using gate arrays rather than 7400-series devices.
Honeywell HT5000 AN-4 (4pp)

16 **"HT5000 Gate Array: System Partitioning Guidelines"**
(HT5000)
The first phase of implementing a system design using gate arrays is to partition the system into functional blocks, some of which correspond to gate array functions. This note leads the designer through the process with guidelines on partitioning by bus boundaries, available I/O pins, and available gates.
Honeywell HT5000 AN-3 (4pp)

17 **"HT5000 Gate Array: Understanding CML Logic"**
(HE5000)
Describes the notational symbology for the CML high-speed, low-power TTL logic used in the HT5000 gate array, illustrating a CML inverter, latch, OR/NOR gate, AND/NAND gate, and Exclusive OR gate.
Honeywell HT5000 AN-1 (2pp)

18 **"HT5000 Gate Array: Understanding Design Automation"**
(HT5000)
Describes a gate-array development system that lets designers interactively enter schematics, perform logic and fault simulation, automatically place cells and interconnect routing, and create pattern generator tapes for mask fabrication.
Honeywell HT5000 AN-5 (4pp)

CUSTOM/SEMICUSTOM

Gate Arrays (cont)

19 **"High-Performance TTL-Compatible Macrocell Arrays"**
(MCA500ALS, MCA1300ALS)
Introduces a series of macrocell arrays, covering cell types, logic design considerations, performance guidelines, CAD layout, and packaging options.
National Semiconductor AN-361 (38pp)

2 **"High-Voltage, Semi-Custom Component Arrays"**
(ULN-2350C, ULN-2351C)
Describes semi-custom arrays incorporating features not normally found in other arrays: high-voltage thin-film resistors, NPN power transistors, and vertical and lateral PNP transistors.
Sprague TP81-3 (4pp)

3 **"LSI TTL Gate Arrays"**
Describes some simple SSI and MSI circuits that can be converted to LSI-TTL gate arrays.
Ferranti Interdesign APN-26 (8pp)

4 **"On-Chip Memory and Test Functions for Gate Arrays"**
A high-performance M²CMOS array family is described along with considerations for future members incorporating on-chip memory. An advanced gate array incorporating an on-chip memory and test system is also discussed.
National Semiconductor AN-333 (6pp)

5 **"Precision Analog Monochips Host Low-Power, High-Speed Digital"**
The "MO" Series Monochips are semicustom gate arrays that have been optimized for analog circuitry yet can achieve digital speeds on the order of 20 ns. This note illustrates the implementation of an inverter/buffer function.
Ferranti Interdesign APN-30 (7pp)

6 **"SCX Family M²CMOS Gate Array System Cost Analysis"**
(SCX6324)
Because gate arrays become a complete subsystem of the total system cost, there is much more to be considered than just a direct component cost analysis. This note discusses the total system implications and hidden cost of design and manufacturing.
National Semiconductor AN-331 (4pp)

7 **"SCX microCMOS Gate Array Family Application Guide"**
Presents details on a family of high-speed, low-power microCMOS gate arrays.
National Semiconductor (22pp)

8 **"Secrets of CMOS Gate-Array Delay Specs"**
Discusses the importance of getting meaningful propagation delay data for CMOS gate arrays.
Gould AMI (5pp)

9 **"The Advantages of Large Bipolar Semi-Custom Arrays in Linear Systems"**
(MOA, MOB, MOE, MOF, MOG, MOH, MOJ, MOL, MOM, MON)
Relates the history of semi-custom bipolar linear arrays, explains the technology, and describes the cost considerations of semi-custom approaches.
Ferranti Interdesign APN-34 (12pp)

10 **"The Design of ISO3/5 Output Drivers and Buffers"**
(ISO3, ISO5)
Describes the various output structures available in the ISO3/5 family of CMOS gate arrays, their AC and DC parameters, and their proper implementation.
Universal Semiconductor AN1 (4pp)

Gate Arrays (cont)

11 **"The Impact of Semi-Custom ICs on Automotive Applications"**
(MOA, MOB, MOC, MOD, MOE, MOF, MOG, MOH, MOJ, MOL)
Covers some typical automotive or applications of semi-custom ICs, including a position sensor, brake light flasher, electronic cruise control, and speedometer.
Ferranti Interdesign APN-22 (8pp)

12 **"The Use of Bipolar Semiconductor Junctions in Linear Circuit Design"**
Addresses the fundamental properties of bipolar semiconductor junctions and shows how their basic voltage/current logarithmic relationship can be used in many types of circuits.
Ferranti Interdesign APN-33 (21pp)

General

13 **"Feasibility Studies for CMOS Semi-Custom Circuits"**
An in-depth analysis of the issues involved in the decision to go with semicustom circuits.
National Semiconductor AN-385 (15pp)

Linear and Linear/Digital Arrays

14 **"Analog MOS on Semicustom Integrated Circuits"**
(Monochip)
Describes a CMOS semicustom array series that can be used to produce analog and digital circuits on a single chip.
Ferranti Interdesign APN-23

15 **"Designing Low Frequency Filters on the CMOS Monochip"**
(Monochip)
Describes how to design monolithic low-frequency filters using switched capacitor techniques on a semicustom IC. Examples of low-pass, high pass, and band-pass designs are given.
Ferranti Interdesign APN-28 (24pp)

16 **"Low Voltage Bipolar Circuits"**
(Monochip)
Presents device parameters, circuit configurations, and performances of some representative circuits that will operate with a 1-volt supply using Monochip component arrays.
Ferranti Interdesign APN-25 (16pp)

17 **"VJ800 User's Guide"**
(VJ800)
An in-depth survey of the VJ800 analog master chip and the critical issues of designing with it.
VTC VJ800 User's Guide (35pp)

Programmable Logic

18 **"Field Programmable Logic Arrays—An Application Manual"**
Covers basic FPLA operation and described various applications, including a data cartridge tape drive controller, an opcode decoder for the PDP-11, and a combination sync and video generator.
Signetics (116pp)

CUSTOM/SEMICUSTOM

Programmable Logic (cont)

1 **“How to Design with Programmable Logic Arrays”**
(DM8575, DM8576)
Discusses operation of PLAs and use as code converters, decode elements in digital processors and sequential controllers.
National AN-89 (8pp)

2 **“Programmable PROM Memory Expansion”**
(82S102, 82S103)
Describes the use of FPGA in memory intensive systems, which may accept 4K, 8K, 16K, 32K, or 65K PROMs, simply by editing the FPGA program.
Signetics AB-005 (4pp)

3 **“Single Chip Multiprocessor Arbiter”**
Shows how the Field Programmable Logic Sequencer (FPLS) can use state logic to implement a multiprocessor arbiter conveniently and cost effectively.
Signetics AN-007 (4pp)

4 **“93Z459 FPLA Makes Versatile 12-Bit Address Comparator”**
(93Z459)
Details a 12-bit comparator made with an FPLA for use in a memory bank decoder, data trap on communication line, reset/preset for moduloOn counter, or recognition of a multiplexed display output.
Fairchild MHSL-5 (4pp)

5 **“93Z459 FPLA and R-S Latch Form Pulse Synchronizer”**
(93Z459, 74279)
Explains how a 93Z459 FPLA and 74279 R-S latch can emulate the 74120 pulse synchronizer.
Fairchild MHSL-4 (2pp)

6 **“A Study of the Fastest PAL (15 ns Max.) in the Industry—National’s PAL 20B Series”**
(PAL 20B Series)
Describes the electrical characteristics, and applications of the ultra-high-speed PAL20B Series.
National Semiconductor AN-388 (4pp)

7 **“Designing with the EP300 Programmable Logic Devices”**
(EP300)
An introduction to erasable-programmable logic ICs, effective devices for quick development of custom circuits and fast prototyping of circuits to be mass produced.
Altera AN-1 (17pp)

8 **“Field Programmable Logic”**
Provides the first-time user of field programmable logic with a basic understanding of this technology.
Texas Instruments SDPA001 (18pp)

9 **“HPL-16LCB Programmable Output Polarity”**
(HPL16LC8)
Gives details on the implementation and advantages of programmable output polarity in the HPL-16CL8 programmable logic device.
Harris TB-60 (3pp)

10 **“PAL Functional Testing”**
Without functional testing, PAL devices cannot be guaranteed to work properly in a system. This note describes an algorithm for generating test vectors and function tables from logic equations.
National Semiconductor AN-351 (20pp)

Programmable Logic (cont)

11 **“Replacing the 20-Pin Family with the EP300”**
(EP300)
Explains how the EP300 architecture allows configurations that directly replace all functions implemented with the 20-pin PAL family.
Altera AN-2 (11pp)

12 **“Simulating EPLD Designs”**
An introduction to erasable-programmable logic devices, describing structure, logic implementation, delay elements, and simulation. Sample circuit schematics provided.
Altera AN-4 (14pp)

13 **“The 93Z459 FPLA Interfaces Multiplexed 4-Digit Counter to Microprocessor”**
(93Z459)
Shows how a FPLA can be used to design a custom interface that eliminates random logic and software table lookup routines.
Fairchild MHSL-2 (2pp)

14 **“The EP300 is a Memory Interface Controller”**
(EP300)
Shows how erasable/programmable logic devices can be effectively used to replace discrete logic or ROMs in microcomputer address decoding for memory and peripheral devices.
Altera AN-3 (10pp)

15 **“Using the 93Z459 FPLA as a Phase/Frequency Detector”**
(93Z459)
Explains how a phase/frequency detector can be constructed with two packages instead of the four required when using TTL random logic gates.
Fairchild MHSL-1 (4pp)

Standard Cells

16 **“High-Performance TTL Compatible Macrocell Arrays”**
(MCA500ALS, MCA1300ALS)
Provides full details on the company’s Macrocell Array products, including logic design considerations, performance guidelines and CAD layout.
National Semiconductor AN361 (38pp)

17 **“Select Macrocell Array Circuits With a Computer Program”**
Deciding which arrays best fit in a system or how much logic fits in an array can be a complex engineering job. This note describes a computer program that starts with a list of LSTTL part numbers, then selects a bipolar TTL-compatible macrocell array and suggests a possible package.
Motorola Semiconductor AN-927 (12pp)

18 **“VL1000 User’s Guide”**
(VL1000)
Provides details on the VL1000 linear bipolar cell library.
VL1000 User’s Guide (123pp)

19 **“VL2000 User’s Guide”**
(VL2000)
Gives complete details on a high-performance bipolar digital cell library.
VL2000 User’s Guide

SEMICUSTOM/CUSTOM

Programmable Logic

1 **"Ultra-High Speed (15ns Max.) PAL Solves Speed Problem"**
(PAL16L8B, PAL16R4B, PAL16R6B, PAL16R8B)
Describes how a few high-speed programmable logic devices can replace many advanced Schottky TTL SSS/MSI chips. Includes the design of a dual-port RAM arbiter/controller using two of the devices.
National Semiconductor AN-398 (18pp)

PACKAGING

General

1 **"An Applications Guide to 64-Pin/50-Mil-Center Packaging"**
(F945X)
Details on the 64-pin, 50-mil-center DIP used for the F945X family of microprocessors and on applicable sockets.
Fairchild MC-3 (6pp)

2 **"ESD Prevention Manual"**
A primer on protecting ICs from electrostatic discharge, covering such topics as protective bags, cushioning materials, floor surfaces, clothing, and footwear.
Analog Devices AN-E826-5-3/84 (35pp)

3 **"Electrostatic Discharge Control: A Guide to Handling Integrated Circuits"**
Covers methods and materials recommended for protection of ICs against ESD damage or degradation during manufacturing operations vulnerable to ESD exposure.
Harris TB-52 (5pp)

4 **"High-Density Leadless Chip Carrier Packages Increase Reliability, Save Weight"**
(80C86)
An introduction to leadless chip carriers and their advantages in terms of operating temperature, size, and weight.
Harris CMOS Military Applications p. 15 (7pp)

5 **"Introduction to Surface Mounting"**
Describes and discusses leaded chip carriers and related design and assembly topics.
Texas Instruments SMFA001 (9pp)

6 **"SO Package Tape and Reel"**
Basic information on tape and reel packaging for SO-packaged ICs.
Signetics AN-210 (4pp)

IC MASTER BELONGS ON YOUR BOOKSHELF

If you don't have your own IC MASTER, you can obtain your own copy by ordering now. Write for your own copy or order by telephone as described below.

IC MASTER is a two-volume set of technical data carefully organized to direct the engineer to the integrated circuits and related products that are closest to his specific needs. It is the surest way to find the optimum device to answer an engineering design requirement. By ordering now, you won't have to borrow or search for IC MASTER the next time you need it.

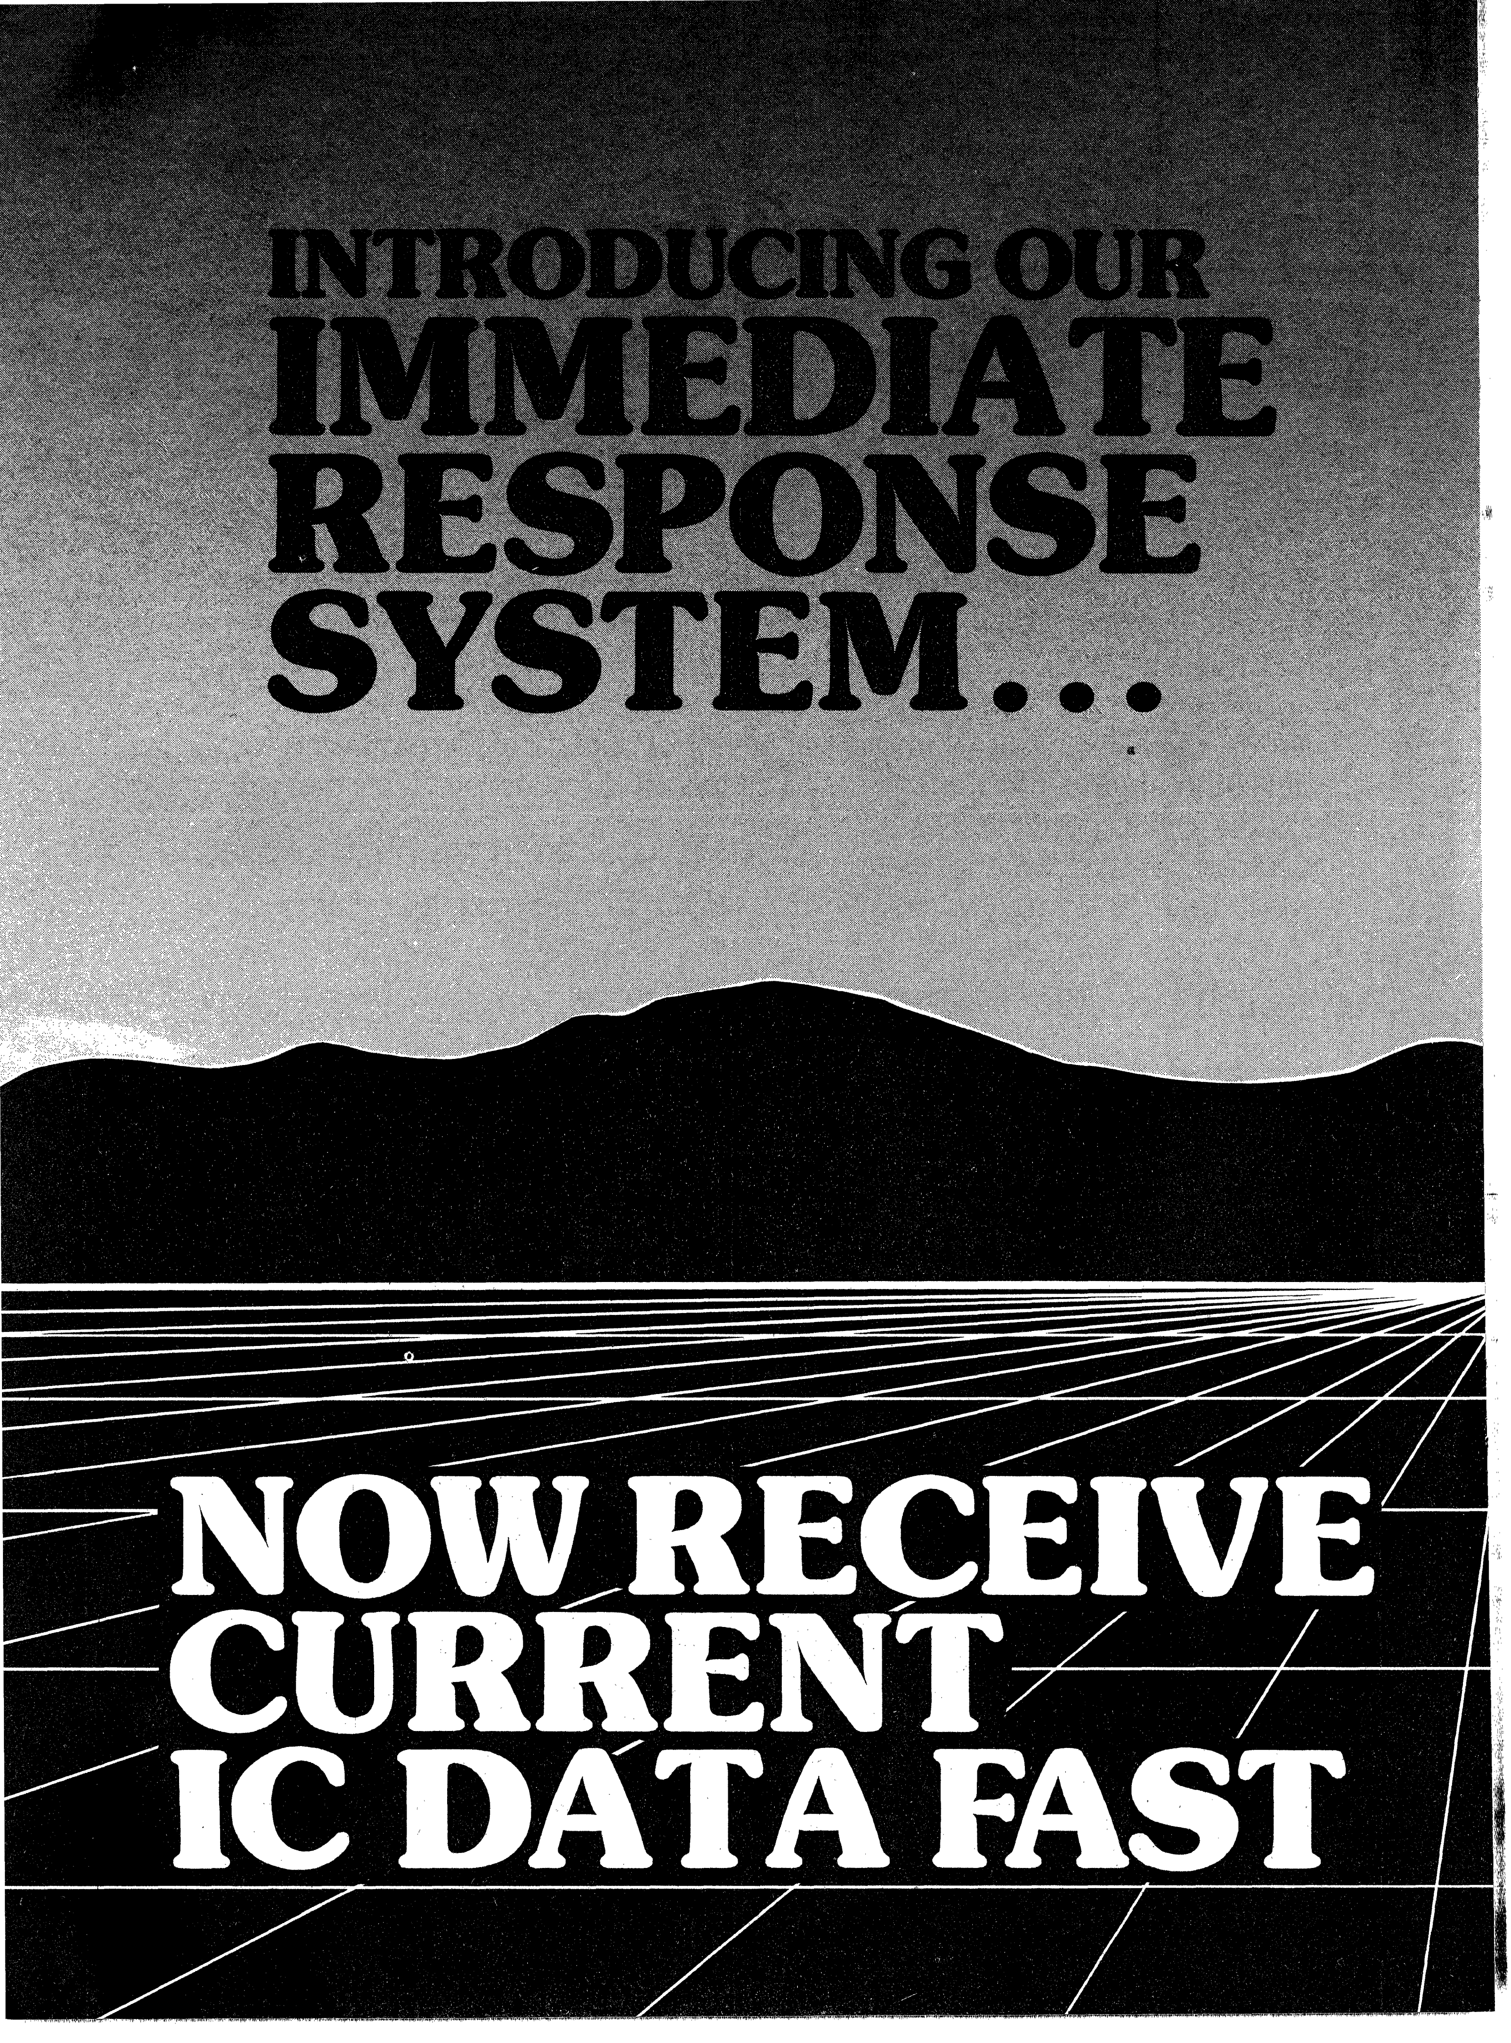
Typical Use of IC MASTER

Can an engineer find out who makes a 256K dynamic RAM with an access time of 120 nanoseconds or faster in less than 30 seconds?
He can if he turns to the Memory section of IC MASTER and looks for the 256K organization (words and bits per word) that he needs.
Because each device is listed in order of access time, he can easily determine the devices that satisfy his speed requirements.

In the United States only:

You can order IC MASTER simply by charging it to your VISA or Master Card credit card. To place your order (USA only) call now: (408) 249-6800/ (516) 227-1300. To order outside the USA, see list of authorized IC MASTER distributors on page 1471 of Vol. I.

ORDER YOUR COPY NOW



INTRODUCING OUR
IMMEDIATE
RESPONSE
SYSTEM...
NOW RECEIVE
CURRENT
IC DATA FAST

19[illegible]

Dear IC MASTER User:

ANNOUNCING . . . A **new,** innovative way to request and receive up-to-date IC product data.

The IC MASTER introduces an IMMEDIATE response system. Operational **24 hours a day, 7 days a week,** you can now phone in your requests for the most current IC product data available from IC manufacturers who have product data sheets in the IC MASTER, at no cost to you. Here's all you do:

Step 1 **Phone 800-443-0100** and ask for Extention #518

Step 2 When asked, simply tell the operator the name(s) of the manufacturer whose part you are interested in . . . the **specific** part number you want information on . . . if you want a data sheet and/or an application note . . . and if you want a salesperson to call.

Step 3 Provide you name, title, company, address, and phone number.

That's all you do! We do the rest. Your request will be in the hands of the company you inquired about within 24 hours.

We will follow up within a week to make sure your request was expedited and your needs were met.

It's important to us that we provide you with the best source of up-to-date IC product data available in the market . . . we've been doing it for over ten years, and we aren't stopping now.

We hope this **added new** service will contribute to a further reduction in your IC selection time.

call 800-443-0100 518 (ext.)

WHAT'S NEW IN IC Updates

IF YOU NEED THE IC MASTER YOU NEED THE IC UPDATES

Not only will the IC UPDATES update your IC Master Catalog they will provide valuable IC application and selection information in every issue.

SPRING, SUMMER and FALL

and remember our toll free number for up-to-date product information: **800 443-0100 (EXT.) 518**

MILITARY PARTS DIRECTORY

This section is divided into three parts: a table of those manufacturers willing to perform MIL-STD-883 screening, a two-way military to commercial cross reference index, and the Qualified Parts List broken down into functions. It not only shows what devices are on the list and which manufacturers supply them, but also it decodes the military numbers into familiar terms.

Detailed Product Information provided by:

Circuit Technology Inc.	601
Fairchild	603
Harris	624
Hughes Aircraft	683
Inmos	685
Micro Power Systems	688
Monolithic Memories	689
Mostek	694
Motorola	696
Raytheon	700
RCA Solid State	702
Texas Instruments	707
Xicor	734

The manufacturers listed above have provided detailed information on their latest and most significant products.

HOW TO USE THE MILITARY PARTS DIRECTORY

The following Military Device Testing table shows the manufacturers who have advised that they want to screen devices to MIL-STD-883 and/or perform other environmental screening. The table also indicates which companies are currently qualified to supply one or more devices on the QPL list. Such achievement is apt to indicate that these companies are well equipped to perform 883 testing. The Military Parts Index provides convenient cross equivalents; plus indication of which devices are listed in the latest QPL.

The heart of this section is the Military Parts Directory, which is a functional QPL parts list. It is based on the latest Defense Electronics Supply Center Qualified Products List (QPL-38510-XX) at the time of publication. The revision and date of this list are indicated at the bottom of each page. The devices are identified by major functions; within each function the devices are arranged in alphanumeric order, which automatically groups CMOS together, 5400 Series together, etc.

A complete military part number includes a three letter suffix signifying the device class and packaging. The definitions of these letters are given in the Part Number Guide under "JAN Nomenclature." The package styles and lead finishes that each manufacturer is qualified to supply can be determined by consulting the official QPL or by contacting the individual manufacturers. Once you have found the names of the companies you need to contact, you can reach them by using the information in the Manufacturers and Distributors Directory.

VERZEICHNIS MILITÄRISCHER ICs

Dieser Abschnitt besteht aus drei Teilen: einem Verzeichnis de Hersteller, welche eine Prüfung nach Mil-Standard 883 vornehmen, eine sowohl militärische als auch kommerzielle Äquivalenzliste und die QPL-Listung nach Funktionen. Hier wird nicht nur genannt, welche Bauelemente verfügbar sind und wer sie liefert, sondern es werden au*β*erdem militärische Typennummern in allgemeinverständliche umgeschlüsselt.

GEBRAUCHSANLEITUNG FÜR DAS VERZEICHNIS MILITÄRISCHER ICs

Die nächste Seite enthält eine Liste jener Hersteller, dia eine Prüfung nach MIL-Standard 883 vornehmen und/oder andere Tests für verschärfte Umweltbedingungen durchführen. Die Liste zeigt au*β*erdem, welche Firmen gegenwärtig für die Lieferung von einem oder mehreren Bauteilen nach QPL qualifiziert sind. Eine solche Qualifikation ist ein Hinweis darauf, da*β* diese Firmen für eine Prüfung nach 883 gut ausgerüstet sind. Die folgenden vier Seiten enthalten praktische Äquivalenzlisten von M38510-Nummern zu deren kommerziellen Bezeichnungen mit einem Hinweis darauf, welche Bauteile in der neuesten QPL-Listung aufgeführt sind.

Das Kernstück dieses Abschnitts ist die QPL-Liste nach Funktionen. Sie basiert auf der neuesten Defense Electronics Supply Center Qualified Products List (QPL-385 10-XX) zum Zeitpunkt der Drucklegung. Die Ausgabe und das Datum dieser Liste werden am Ende jeder Seite angegeben. Die Bauteile sind nach den wichtigsten Funktionen geordnet. Innerhalb jeder Funktion werden sie in alphanumerischer Reihenfolge aufgeführt, so da*β* automatisch CMOS zusammen sind, 5400 Serien zusammen sind usw.

Eine Vollstandige Militärische Typennummer umfast ein Suffix von drei Bruchstaben, welche die Klassifizierung und Gehäuseform des Bauelements bedeuten. Diese Buchstaben werden im Numerischen Typenverzeichnis unter "JAN Nomenclature" erläutert. Die Gehäuseformen und Ausführung der Anschlüsse, die jeder Hersteller liefern darf, können über die offizielle QPL-Listung oder über die einzelnen Hersteller in Erfahrung gebracht werden. Haben Sie einmal die Namen der Firmen gefunden, die Sie brauchen, können Sie weitere Informationen über das Hersteller- und Distributoren-verzeichnis erhalten.

CATALOGUE DES PIECES MILITAIRES

Cette section est divisée en trois catégories : un tableau des fabricants se conformant à la méthode MIL-STD-883, un index de référence entre le domaine militaire et le domaine industriel, et une liste par fonction des pièces qualifiées (QPL). Non seulement les appareils figurant sur la liste et les noms de leurs fabricants sont indiqués, mais les numéros des pièces militaires sont décodés en des termes plus compréhensibles pour les industriels.

COMMENT SE SERVIR DU CATALOGUE DES PIECES MILITAIRES

La page suivante offre un tableau donnant les noms des fabricants désireux de sélectionner des appareils suivant la méthode MIL-STD-883, ou d'exécuter d'autres tests d'environnement. Ce tableau énumère également les sociétés actuellement qualifiées pour produire un ou plusieurs appareils figurant sur la Liste de Pièces Militaires (QPL). Il est sous-entendu que ces sociétés possèdent l'equipement nécessaire pour accomplir les tests éxigés par la méthode 883. Les quatre pages suivantes fournissent un index pratique de référence entre les numéros de la méthode M38510 et leurs équivalents industriels, ainsi que la liste des appareils figurant sur la QPL la plus récente.

Le coeur de cette section est la Liste des Pièces Qualifiées. Elle est basée sur l'edition las plus recente de la QPL publiée par le "Defense Electronics Supply Center" lors de la publication de ce catalogue (QPL-38510-XX). Le numéro et la date de révision de cette liste sont indiqués au bas de chaque page. Les appareils sont identifiés par fonctions principales. Dans chaque fonction les appareils sont indiqués par ordre alphanumérique, ce qui regroupe automatiquement les CMOS ensemble, les séries 5400 ensemble, etc. . .

Un numéro complet de pièce militaire comprend un suffixe de trois lettres qui détermine lat catégorie de l'appareil et le type de boitier utilisé. La définition de ces lettres est fournie dans le Guide des Numéros de Pièces (Part Number Guide) sous la nomenclature JAN. Les types de boitier et de finition que chaque fabricant est qualifié de produire, peuvent être déterminés en consultant la QPL officielle ou en contactant les fabricants respectifs. Une fois que vous connaissez les noms des sociétés que vous desirez contacter, vous pourrez en obtenir les adresses et numéros de téléphone en consultant l'Annuaire des Fabricants et Distributeurs (Manufacturers and Distributors Directory).

DIRECTORIO DE PARTES PARA USO MILITAR

Esta sección está dividada en tres partes: Una tabla de aquellos fabricantes que seleccionan componentes de acuerdo a la ESPECIFICATIÓN MILITAR-883*, un índice de referencia entre componentes militares y comerciales, y una Lista de partes subdividida en funciones. No solo muestra que componentes forman parte de la lista y que fabricantes la proveen, sino también traduce los números militares a términos familiares.

MODO DE EMPLEO DEL DIRECTORIO DE PARTES PARA USO MILITAR

La siguiente página contiene una tabla de fabricantes que desean seleccionar partes de acuerdo a la ESPECIFICACION MILITAR-883 y/o ejecutar otro tipo de segregación ambiental. La tabla también indica que compañías están calificadas para proveer una o más componentes en la lista QPL. Esta proeza es un indicio que dichas compañías están equipadas para ejecutar la prueba 883. Las siguientes cuatro páginas proveen referencias convenientes entre los números M3851 y sus equivalentes comerciales, además indica que componentes aparecen en la lista más reciente de QPL.

La importancia de esta sección está en la lista funcional de componentes QPL. Está basada en la lista de productos del Centro de Abastecimiento de Defensa Electronica más reciente (QPL-38510-XX) antes de su publicación. La revisión y fecha de esta lista aparecen al pie de cada página. Las componentes están identificadas de acuerdo a funciones; que a su vez están organizadas en ordén alfabético-numérico, que automáticamente agrupa las familias CMOS, 5400, etc.

La numeración completa de una componente militar incluye un sufijo de tres letras alfabéticas que determinan la clase y estilo constructivo de la componente. Las definiciones de estas letras se encuentran en la Guía de Numero de Pieza bajo "nomenclatura JAN." El estilo constructivo y acabado de las terminales que cada fabricante suple puede ser determinado consultando el QPL oficial o comunicándose con los fabricantes mismos. Después de haber averiguado los nombres de las compañías a las que deberá dirigirse, puede ponerse en contacto con ellos por medio del Directorio de Fabricantes y Distribuidores.

ミリタリー用部品録

このセクションは次の３部門に分れています。(1)ＭＩＬ-ＳＴＤ-８８３のスクリーニングをするメーカー表，(2)一般型名からミリタリー番号を，ミリタリー番号から一般型名を探し出すクロスリファレンス表，(3)機能別に分類された認定部品表，これは部品名丈でなくそのメーカー名とミリタリー番号のなじみの深い用語への対応も網羅しています。

使用方法

次ページにはＭＩＬ-ＳＴＤ-８８３並に他のスクリーニングをするメーカー名が記載されています。その表にはどのメーカーが現在ＱＰＬ（認定部品表）上のどんな製品の供給に認定されているかも示していますから，記載されているメーカーが８８３による試験設備を備えているかどうか判断することも出来ます。その後の４ページはミリタリーから一般型名，一般型名からミリタリーのクロスリファレンスで最新のＱＰＬに記載されている型名も分ります。

このセクションの最も大切な所は機能別ＱＰＬ部品リストです。これは本マスター発行時点で最新の国防省電子部品供給センター（ＤＥＳＣＥ）認定品リスト（ＱＰＬ-３８５１０-××）に基くものです。本リストの改定又は日付は各ページの下欄に示されています。デバイスは主要機能毎に記載されています。その機能毎にデバイスはアルファベット順にのっていますのでＣＭＯＳはＣＭＯＳ内に，５４００シリーズは５４００シリーズ内にまとめられています。

ミリタリー部品番号はデバイスのクラス分けパッケージ分けを示す３文字のサフィックスを入れています。この３文字の規定はパーツナンバーガイドのＪＡＮノーメンクラチュアに記載されています。各メーカーが認定されているパッケージ形状とリード仕上げは公式のＱＰＬを見るか個々のメーカーに連絡して下さい。連絡先の住所，電話番号等は〝メーカー，代理店ダイレクトリー〞にのせてあります。

EXPLANATION:

The "MIL-M-38510" section indicates the IC manufacturers currently providing Q.P.L. ICs. More detailed information on the specific devices is given in the Qualified Products lists which follow.

The "MIL-STD-883 Screening" section lists those manufacturers who are both set up and actively want to screen devices to the levels indicated. "Other Screening" shows those who report that they want business calling for special military and industrial environmental screening procedures.

SECTION	PRODUCTS IN SECTION
Digital	Arithmetic functions, buffers/inverters, counters, decoders, drivers, flip-flops, gates, latches, memories, multiplexers, multivibrators, oscillators/dividers, shift registers, translators.
Military	Military-commercial and commercial-military cross-references; QPL-38510/xx list; military ICs.
Microprocesser	Microprocessors, microcomputers, and microprocessor system components.
Microprocessor Development Systems	Systems covered range from simple, single-user, text-editing stations to multi-user computers dedicated to software development.
Microcomputer Support Boards	Boards with functions and peripheral controllers.
Interface	Analog switches, analog-to-digital converters, digital-to-analog converters, display converters, display drivers, error checking circuits, keyboard encoders-decoders, drivers, sense amplifiers, and transmitters/receivers.
Linear	Special-purpose amplifiers, arrays, comparators, consumer circuits, followers, operational amplifliers, phase locked loop circuits, telecommunication circuits, timers, voltage regulators, and special functions.
Memory	Character generators, code converters, FIFOs, LIFOS, E²PROMs, PROMs, RAMs, ROMs and shift registers.
Custom/ Semicustom	Custom/Semicustom linear and digital gate arrays, standard cells, programmable logic arrays (PLAs), and all compatible design tools.
Design Automation	Design Automation interrelated tables showing relationships among workstations, computers, software, semicustom manufacturers and CAE/CAD providers.
SMD Packages	Surface Mount Directory from base device numbers to surface mount packages and suppliers.
Alternate Source Directory	Alternate Source Directory... Industry-wide alternate source cross reference pin-for-pin and functional equivalents to available ICs.

A good design

is “mastered” early.

The best time for an engineer to pick the integrated circuits that will go into his next design is at an early stage in the design process when the engineer's plans are still flexible enough to take full advantage of the features selected.

There is a point in the early phases of every design when engineers focus on selecting integrated circuits. They examine specifications, weigh relative strengths and weaknesses of various devices, and choose the field of candidates. This critical time in the design cycle when designers want to be sure the right devices are in serious contention for their applications.

This is when the engineer reaches into his technical reference library. Of the material on his shelves, **IC MASTER** is the only reference source that has been especially prepared for this moment.

The engineer can look up each precise function that he needs and see all of the devices—and their manufacturers—that might satisfy his requirements. He sees this information for all manufacturers, not just for advertisers. But if an IC maker has chosen to include technical data for his products in **IC MASTER**, the engineer sees each index listing for that manufacturer in **bold face type** accompanied by the **page number** on which the data appears; the engineer can then turn immediately to the advertiser's technical data to see if the device fits his needs.

Next time, begin with the MASTER. . .where engineering design begins!

IC MASTER

WHAT'S NEW IN IC Updates

DON'T MISS THE IC UPDATES

The updates
keep your IC Master
current the year 'round.

IC MASTER BELONGS ON YOUR BOOKSHELF

If you don't have your own IC MASTER, you can obtain your own copy by ordering now. Write for your own copy or order by telephone as described below.

IC MASTER is a two-volume set of technical data carefully organized to direct the engineer to the integrated circuits and related products that are closest to his specific needs. It is the surest way to find the optimum device to answer an engineering design requirement. By ordering now, you won't have to borrow or search for IC MASTER the next time you need it.

Typical Use of IC MASTER

Can an engineer find out who makes a 256K dynamic RAM with an access time of 120 nanoseconds or faster in less than 30 seconds?
He can if he turns to the Memory section of IC MASTER and looks for the 256K organization (words and bits per word) that he needs.
Because each device is listed in order of access time, he can easily determine the devices that satisfy his speed requirements.

In the United States only:

You can order IC MASTER simply by charging it to your VISA or Master Card credit card. To place your order (USA only) call now: (408) 249-6800/ (516) 227-1300. To order outside the USA, see list of authorized IC MASTER distributors on page 1471 of Vol. I.

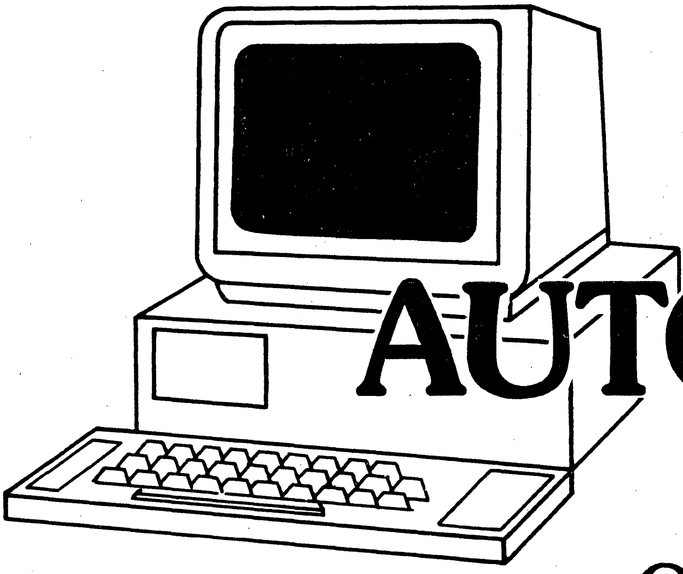
ORDER YOUR COPY NOW

WHAT'S NEW IN IC MASTER

DON'T MISS THE EXPANDED CUSTOM/ SEMICUSTOM IC SECTION

Lists software design tools available for Programmable Logic Devices, Gate Arrays, Standard Cells, and Linear and Linear/ Digital Arrays. Major macros in VLSI/LSI Macrocell Libraries are listed by source.

Volume II, page 4401



DON'T MISS THE NEW DESIGN AUTOMATION IC SECTION

Quick and easy way to determine relationships between workstations, computers, software, semicustom manufacturers and CAE/CAD providers.

Volume II, page 4901

NEW-RECEIVE DATA FAST!

Dear IC MASTER User:

ANNOUNCING . . . A **new**, innovative way to request and receive up-to-date IC product data.

The IC MASTER introduces an IMMEDIATE response system. Operational **24 hours a day, 7 days a week,** you can now phone in your requests for the most current IC product data available from IC manufacturers who have product data sheets in the IC MASTER, at no cost to you. Here's all you do:

Step 1 **Phone** 800-443-0100 and ask for Extension #518

Step 2 When asked, simply tell the operator the name(s) of the manufacturer whose part you are interested in . . . the **specific** part number you want information on . . . if you want a data sheet and/or an application note . . . and if you want a salesperson to call.

Step 3 Provide your name, title, company, address, and phone number.

That's all you do! We do the rest. Your request will be in the hands of the company you inquired about within 24 hours. We will follow up within a week to make sure your request was expedited and your needs were met.

It's important to us that we provide you with the best source of up-to-date IC product data available in the market . . . we've been doing it for over ten years, and we aren't stopping now.

We hope this **added new** service will contribute to a further reduction in your IC selection time.

CTI'S QUICK SELECTION GUIDE FOR MIL-STD-1553.

CTI has long been recognized as a specialist in designing and producing hi-rel microcircuits for the military. We're now a major supplier of standard bus circuits for MIL-STD-1553, with products in use in most major military and space programs (F-18, A-10, LAMPS, and many more). Call or write for details to Circuit Technology Inc., 160 Smith Street, Farmingdale, NY 11735 516/293-8686.

NOW: RECEIVE DATA FAST! 800 443-0100 518 EXT.

Dear IC MASTER User:

ANNOUNCING . . . A **new,** innovative way to request and receive up-to-date IC product data.

The IC MASTER introduces an IMMEDIATE response system. Operational **24 hours a day, 7 days a week,** you can now phone in your requests for the most current IC product data available from IC manufacturers who have product data sheets in the IC MASTER, at no cost to you. Here's all you do:

Step 1 **Phone 800-443-0100** and ask for Extension #518

Step 2 When asked, simply tell the operator the name(s) of the manufacturer whose part you are interested in . . . the **specific** part number you want information on . . . if you want a data sheet and/or an application note . . . and if you want a salesperson to call.

Step 3 Provide your name, title, company, address, and phone number.

That's all you do! We do the rest. Your request will be in the hands of the company you inquired about within 24 hours.

We will follow up within a week to make sure your request was expedited and your needs were met.

It's important to us that we provide you with the best source of up-to-date IC product data available in the market . . . we've been doing it for over ten years, and we aren't stopping now.

We hope this **added new** service will contribute to a further reduction in your IC selection time.

ORDERING CODES

MIL-STD-883 (QB) Example

54F240 D M QB

- 54F240 — Basic Device Type
- D — Package Code
  - D = Ceramic Dual In-Line
  - F = Ceramic Flat Pack
  - L1 = Ceramic Leadless Chip Carrier*
- M — Military Temperature Range: −55° to +125°C
- QB — MIL-STD-883 Level B Process Flow

*NOTE: 14, 16 and 20-pin devices are supplied in 20-terminal square leadless chip carriers.

Fairchild JAN Cross Reference Guide

Introduction

This Fairchild JAN Cross Reference Guide is provided as a tool to assist in the determination of MIL-M-38510 product availability. The guide is organized by logic family with generic part numbers listed alphanumerically for quick reference. The second column marked "JM38510/" is a listing of military part numbers for Fairchild JAN qualified devices. All QPL sources are indicated in subsequent columns. Alternate source product may vary in respect to lead finish or 14 pin flatpack case outline.

Ordering Codes

MIL-M-38510 (JAN)
Example

JM38510/ 346 02 B R A

JM38510/: MIL-M-38510 Basic Specification
346: Slash Sheet
02: Device Number
B: Screening Class B
R: Case Outline
A: Lead Finish

Lead Finish
A = Solder Dipped
B = Tin Plate

Case Outline
A = ¼" x ¼" Flat Pack, 14-pin, Ceramic
C = ¼" x ¾" Dual In-Line, 14-pin, Ceramic
D = ¼" x ⅜" Flat Pack, 14-pin, Ceramic*
E = ¼" x ¾" Dual In-Line, 16-pin, Ceramic
F = ¼" x ⅜" Flat Pack, 16-pin, Ceramic
J = ½" x 1¼" Dual In-Line, 24-pin, Ceramic*
R = ¼" x 1 1/16" Dual In-Line, 20-pin, Ceramic
S = ¼" x ½" Flat Pack, 20-pin, Ceramic*

HS-80C85RH

Radiation Hardened 8 Bit CMOS Microprocessor

October 1985 ***Advance Information***

Features

- **100% Software Compatible with INTEL 8085**
- **Radiation Hardened**
  - **5MHZ Operation, Post Radiation at 10 Volts**
  - **Total Dose .... 1 × 10^5 RAD(Si)**
  - **Transient Upset .... >1 × 10^8 RAD(Si)/sec**
  - **Latch-up Immune EPI-CMOS .... >1 × 10^{12}RAD(Si)***
- **Completely Static Design**
  - **Operation From DC to 5MHZ**
- **Low Standby Current**
- **Single Power Supply (+5V or +10V Operation)**
- **On Chip Clock Generator and System Controller**
- **Four Vectored Interrupt Inputs**
- **Self Aligned Junction Isolated CMOS Process**
- **Electrically Equivalent to Sandia SA3000**
- **−55°C to +125°C Operation**

Description

The Harris HS-80C85RH radiation hardened, 8-bit CMOS CPU is manufactured using a self-aligned, junction isolated, silicon gate CMOS process. It is a functional logic emulation of the HMOS 8085 and its instruction set is 100% software compatible with the HMOS device. The HS-80C85RH is designed for operation at +10V, but can be operated at +5V if reduced operating speed is acceptable. Its high level of integration allows the construction of a radiation hardened microcomputer system with as few as three ICs (HS-80C85RH CPU, HS-81C55RH/56RH RAM/IO, and HS-83C55RH ROM/IO). Contact your local sales office for sample availability.

BASIC SYSTEM TIMING

The HS-80C85RH has a multiplexed Data Bus. ALE is used as a strobe to sample the lower 8-bits of address on the Data Bus. Figure 9 shows an instruction fetch, memory read and I/O write cycle (as would occur during processing of the OUT instruction). Note that during the I/O write and read cycle that the I/O port address is copied on both the upper and lower half of the address.

There are seven possible types of machine cycles. Which of these seven takes place is defined by the status of the three status lines (IO/$\overline{M}$, S_1, S_0) and the three control signals ($\overline{RD}$, $\overline{WR}$, and $\overline{INTA}$). (See Table 3.) The status lines can be used as advanced controls (for device selection, for example), since they become active at the T_1 state, at the outset of each machine cycle. Control lines $\overline{RD}$ and $\overline{WR}$ are used as command lines since they become active when the transfer of data is to take place.

A machine cycle normally consists of three T states, with the exception of OPCODE FETCH, which normally has either four or six T states (unless WAIT or HOLD states are forced by the receipt of $\overline{READY}$ or HOLD inputs). Any T state must be one of ten possible states, shown in Table 4.

Table 3. HS-80C85RH Machine Cycle Chart

MACHINE CYCLE			STATUS			CONTROL		
			IO/$\overline{M}$	S1	S0	$\overline{RD}$	$\overline{WR}$	$\overline{INTA}$

Description

The Harris HS-81C55RH/81C56RH are radiation hardened RAM and I/O chips fabricated using a self-aligned silicon gate CMOS process. The chips are intended for use in the 80C85RH radiation hardened microprocessor system. The RAM portion is designed as 2048 static cells organized as 256 × 8. A maximum, post-radiation access time of 300ns permits use with no wait states in the 80C85RH CPU. The HS-81C55RH contains an active low chip enable while the HS-81C56RH has an active high chip enable. Although designed for operation at 10V, the chips can be operated at 5V if reduced operating speed can be accepted. Contact your local sales office for sample availability.

Table 1. Pin Description

Symbol	Type	Name and Function
RESET	I	**Reset:** Pulse provided by the HS-80C85RH to initialize the system (connect to HS-80C85RH RESET OUT). Input high on this line resets the chip and initializes the three I/O ports to input mode. The width of RESET pulse should typically be two HS-80C85RH clock cycle times.
AD_{0-7}	I/O	**Address/Data:** 3-state Address/Data lines that interface with the CPU lower 8-bit Address/Data Bus. The 8-bit address is latched into the address latch inside the HS-81C55/56RH on the falling edge of ALE. The address can be either for the memory section or the I/O section depending on the $IO/\overline{M}$ input. The 8-bit data is either written into the chip or read from the chip, depending on the $\overline{WR}$ or $\overline{RD}$ input signal.
CE or $\overline{CE}$	I	**Chip Enable:** On the HS-81C55RH, this pin is $\overline{CE}$ and is ACTIVE LOW. On the HS-81C56RH, this pin is CE and is ACTIVE HIGH.
$\overline{RD}$	I	**Read Control:** Input low on this line with the Chip Enable active enables and AD_{0-7} buffers. If $IO/\overline{M}$ pin is low, the RAM content will be read out to the AD bus. Otherwise the content of the selected I/O port or command/status registers will be read to the AD bus.
$\overline{WR}$	I	**Write Control:** Input low on this line with the Chip Enable active causes the data on the Address/Data bus to be written to the RAM or I/O ports and command/status register, depending on $IO/\overline{M}$.
ALE	I	**Address Latch Enable:** This control signal latches both the address on the AD_{0-7} lines and the state of the Chip Enable and $IO/\overline{M}$ into the chip at the falling edge of ALE.
$IO/\overline{M}$	I	**I/O Memory:** Selects memory if low and I/O and command/status registers if high.
$PA_{0-7}(8)$	I/O	**Port A:** These 8 pins are general purpose I/O pins. The in/out direction is selected by programming the command register.
$PB_{0-7}(8)$	I/O	**Port B:** These 8 pins are general purpose I/O pins. The in/out direction is selected by programming the command register.
$PC_{0-5}(6)$	I/O	**Port C:** These 6 pins can function as either input port, output port, or as control signals for PA and PB. Programming is done through the command register. When PC_{0-5} are used as control signals, they will provide the following: PC_0 — A INTR (Port A Interrupt) PC_1 — ABF (Port A Buffer Full) PC_2 — $\overline{A\ STB}$ (Port A Strobe) PC_3 — B INTR (Port B Interrupt) PC_4 — B BF (Port B Buffer Full) PC_5 — $\overline{B\ STB}$ (Port B Strobe)
TIMER IN	I	**Timer Input:** Input to the counter-timer.
$\overline{TIMER\ OUT}$	O	**Timer Output:** This output can be either a square wave or a pulse, depending on the timer mode.
V_{CC}	I	**Voltage:** +5 volt to +10 volt supply.
GND	I	**Ground:** Ground reference.

FUNCTIONAL DESCRIPTION

The HS-81C55RH/81C56RH contains the following:

- 2K Bit Static RAM organized as 256 × 8
- Two 8-bit I/O ports (PA & PB) and one 6-bit I/O port (PC)
- 14-bit timer-counter

The $IO/\overline{M}$ (IO/Memory Select) pin selects either the five registers (Command, Status, PA_{0-7}, PB_{0-7}, PC_{0-5}) or the memory (RAM) portion.

The 8-bit address on the Address/Data lines, Chip Enable input CE or $\overline{CE}$ and $IO/\overline{M}$ are all latched on-chip at the falling edge of ALE.

Description

The Harris HS-83C55RH is a ROM and I/O chip intended for use in the HS-80C85RH radiation hardened microprocessor system. Fabricated using the Harris self-aligned silicon gate CMOS process, the chips has a maximum access time of 200ns after exposure to 1×10^5 rads (Si). The chip is designed for operation at +10V, but can be operated at +5V if reduced operating speed is acceptable. The device is electrically equivalent to the Sandia SA3002. Contact your local sales office for sample availability.

Table 1. Pin Description

Symbol	Type	Name and Function
ALE	I	**Address Latch Enable:** When high, AD_{0-7}, $IO/\overline{M}$, A_{8-10}, CE_2, and $\overline{CE}_1$ enter the address latches. The signals (AD, $I/O\overline{M}$, A_{8-10}, CE_2, CE_1) are latched in at the trailing edge of ALE.
AD_{0-7}	I	**Address/Data Bus (Bidirectional):** The lower 8-bits of the ROM or I/O address are applied to the bus lines when ALE is high. During an I/O cycle, Port A or B is selected based on the latched value of AD_0. If $\overline{RD}$ or $\overline{IOR}$ is low when the latched chip enables are active, the output buffers present data on the bus.
A_{8-10}	I	**Address Bus:** High order bits of the ROM address. They do not affect I/O operations.
$\overline{CE}_1$ CE_2	I	**Chip Enable Inputs:** $\overline{CE}_1$ is active low and CE_2 is active high. The HS-83C55RH can be accessed only when *BOTH* Chip Enables are active at the time the ALE signal latches them in. If either Chip Enable input is not active, the AD_{0-7} and .READY outputs will be in a high impedance state.
$IO/\overline{M}$	I	**I/O Memory:** If the latched $IO/\overline{M}$ is high when $\overline{RD}$ is low, the output data comes from an I/O port. If it is low, the output data comes from the ROM.
$\overline{RD}$	I	**Read:** If the latched Chip Enables are active when $\overline{RD}$ goes low, the AD_{0-7} output buffers are enabled and output either the selected ROM location or I/O port. When both $\overline{RD}$ and $\overline{IOR}$ are high, the AD_{0-7} output buffers are 3-stated.
$\overline{IOW}$	I	**I/O Write:** If the latched Chip Enables are active, a low on $\overline{IOW}$ causes the output port pointed to by the latched value of AD_0 to be written with the data on AD_{0-7}. The state of $IO/\overline{M}$ is ignored.
CLK	I	**Clock:** Used to force the READY into its high impedance state after it has been forced low by $\overline{CE}_1$ low, CE_2 high and ALE high.
READY	0	**READY:** A 3-state output controlled by $\overline{CE}_1$, CE_2, ALE and CLK. READY is forced low when the Chip Enables are active during the time ALE is high, and remains low until the rising edge of the next CLK.
PA_{0-7}	I/O	**Port A:** General purpose I/O pins. Their input/output direction is determined by the contents of the Data Direction Register (DDR). Port A is selected for write operations when the Chip Enables are active and $\overline{IOW}$ is low and a 0 was previously latched from AD_0, AD_1. Read operation is selected by either $\overline{IOR}$ low and active Chip Enables and AD_0 and AD_1 low, *or* $IO/\overline{M}$ high, RD low, active chip enables, and AD_0 and AD_1, LOW.
PB_{0-7}	I/O	**Port B:** This general purpose I/O port is identical to Port A except that it is selected by a 1 latched from AD_0 and a 0 from AD_1.
RESET	I	**Reset:** An input high causes all pins in Port A and B to assume input mode. (Clear DDR Register.)
$\overline{IOR}$	I	**I/O Read:** When the Chip Enables are active, a low on $\overline{IOR}$ will output the selected I/O port onto the AD bus. $\overline{IOR}$ low performs the same function as the combination $IO/\overline{M}$ high and $\overline{RD}$ low. When $\overline{IOR}$ is not used in a system, $\overline{IOR}$ should be tied to V_{CC}.
V_{CC}	I	**Voltage:** +5 volt to +10 volt supply.
GND	I	**Ground:** Ground Reference.

Functional Description

ROM Section

The HS-83C55RH contains an 8-bit address latch which allows it to interface directly to the HS-80C85RH Microprocessor without additional hardware.

The ROM section of the chip is addressed by an 11-bit address and the Chip Enables. The address and levels on the Chip Enable pins are latched into the address latches on the falling edge of ALE. If the latched Chip Enables are active and $IO/\overline{M}$ is low when $\overline{RD}$ goes low, the contents of the ROM location addressed by the latched address are put out through AD_{0-7} output buffers.

I/O Section

The I/O section of the chip is addressed by the latched value of AD_{0-1}. Two 8-bit Data Direction Registers (DDR) in the HS-83C55RH determine the input/output status of each pin in the corresponding ports. A "0" in a particular bit position of a DDR signifies that the corresponding I/O port bit is in the input mode. A "1" in a particular bit position signifies that the corresponding I/O port bit is in the output mode. In this manner the I/O ports of the HS-83C55RH are bit-by-bit programmable as inputs or outputs. The table summarizes port and DDR designation. DDR's cannot be read.

AD_1	AD_0	Selection
0	0	Port A
0	1	Port B
1	0	Port A Data Direction Register (DDR A)
1	1	Port B Data Direction Register (DDR B)

When $\overline{IOW}$ goes low and the Chip Enables are active, the data on the AD_{0-7} is written into the I/O port selected by the latched value of AD_{0-1}. During this operation all I/O bits of selected port are affected, regardless of their I/O mode and the state of $IO/\overline{M}$. The actual output level does not change until $\overline{IOW}$ returns high (glitch free output). A port can be read out when the latched Chip Enables are active and either $\overline{RD}$ goes low with $IO/\overline{M}$ high, or $\overline{IOR}$ goes low. Both input and output mode bits of a selected port will appear on lines AD_{0-7}.

Description

The Harris HS-54C138RH is a radiation hardened 3 to 8 decoder fabricated using a radiation hardened EPI-CMOS process. It features low power consumption, high noise immunity, and high speed. Also featured are pin and function compatibility with the 54LS138 industry standard part. The HS-54C138RH is ideally suited for high speed memory chip select address decoding. It is intended for use with the Harris HS-80C85RH radiation hardened microprocessor, but it can also be utilized as a demultiplexer in any low power rad-hard application. (See section on applications.)

The HS-54C138RH contains a one of eight binary decoder. A three bit binary input is used to select and activate each of the eight outputs, provided the three chip enable inputs are also present (see truth table).

The HS-54C138RH has an on-chip enable gate. The active high (G1) and both active low ($\overline{G2A}$,$\overline{G2B}$) inputs are Anded together to provide a single enable input to the device. See logic diagram on page 1. The use of both active high and active low inputs minimizes the need for external gates when expanding a system.

Description

The Harris HS-3374RH is a radiation-hardened 8-Bit bidirectional level converter designed to interface CMOS logic levels with TTL logic levels in radiation-hardened bus oriented systems. The HS-3374RH is fabricated using a radiation hardened EPI-CMOS process and features eight parallel bidirectional buffer/level converters.

Two control inputs, ENABLE and DISABLE, are used to determine the direction of data flow, and to set both the inputs and outputs in the high impedance state. The control inputs may be driven by either TTL or CMOS logic drivers capable of sinking one standard TTL load.

The HS-3374RH is a non-inverting version of the industry-standard CD40116. The non-inverting outputs of the HS-3374RH reduce PC board chip count by eliminating the need to restore data back to a non-inverted format.

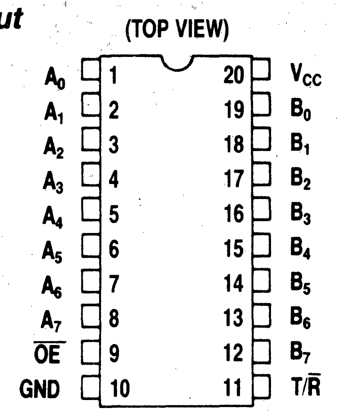
- Electrically Equivalent to Sandia SA2997
- −55°C to +125°C Temperature Operation

Pinout



Description

The Harris HS-82C08RH is a radiation-hardened octal bus transceiver with three-state outputs. It is manufactured using a self-aligned, junction isolated CMOS process and is designed for use with the HS-80C85RH radiation-hardened microprocessor. The HS-82C08RH allows asynchronous two-way communication between data buses. The direction of data flow is determined by the logic level on the transmit/receive ($\overline{T}/R$) input. A logic high on the $\overline{T}/R$ input specifies data flow from Port A to Port B of the device. Conversely, a logic low on the T/R input specifies data flow from Port B to Port A. The Output Enable input disables both ports by placing them in the high impedance state.

The HS-82C08RH is ideally suited for a wide variety of buffering applications in radiation-hardened microcomputer systems.

*Internal Service Request flip-flop.

FUNCTIONAL DESCRIPTION

Data Latch

The data latch is comprised of eight "D" type flip-flops. The output of each flip-flop will follow the corresponding data input (DI_{0-7}) when the clock (C) is high. The clock input is level sensitive and the data becomes latched when the clock returns low.

An asynchronous reset ($\overline{CLR}$) is used to clear the latched data. Since the clock (C) overrides the reset ($\overline{CLR}$), the data must be in the latched state in order to clear the flip-flops. If the data is not latched (i.e., clock is high) when $\overline{CLR}$ goes low, then the Q outputs of the data latch will continue to follow the data inputs, overriding the reset signal.

Output Buffer

Three-state buffers are used to provide output drive for the data latch. A high level on the "output buffer enable" control line enables the buffer outputs. When "output buffer enable" is low the buffer outputs are forced to the high-impedance state.

Device Select Logic

The inputs $\overline{DS1}$ and DS2 are used for device selection. When $\overline{DS1}$ is low and DS2 is high, the device is selected. The output buffers are enabled and the service request flip-flop is asynchronously cleared when the device is selected.

Mode

The mode input (MD) is used to control the state of the output buffer and to determine the source of the data latch clock (C). When MD is high, the output buffers are enabled and the source of the data latch clock (C) is the device select logic ($\overline{DS1} \cdot DS2$).

When MD is low, the state of the output buffer is controlled by the device select logic ($\overline{DS1} \cdot DS2$) and the source of the data latch clock is the strobe (STB) input.

Strobe

The strobe input (STB) is used as the data latch clock (C) when the mode input (MD) is low. The service request flip-flop is synchronously set on the negative going edge of STB.

Service Request Flip-Flop

The service request flip-flop is to generate interrupts to microcomputer systems. It is negative edge triggered and asynchronously cleared (reset).

The output of the service request flip-flop is AND-gated with the device select logic ($\overline{DS1} \cdot DS2$). The output of the AND gate is the active low interrupt ($\overline{INT}$) signal.

HARRIS

HS-80C86RH

PREVIEW

October 1985

Radiation Hardened CMOS 16 Bit Microprocessor

Features

- Pin Compatible with NMOS 8086 and Harris 80C86
- Radiation Hardened
  - Latch Up Free Epi-CMOS
  - Total Dose > 100K RAD(Si)
  - Transient Upset > 10^8 RAD(Si)/sec
  - Total dose capabilities above 1 x 10^5 are available. Contact factory for details.
- Completely Static Design
  - DC to 5MHz
- Low Power Operation
  - ICCSB = 500μA Maximum
  - ICCOP = 10mA/MHz Typical
- 1 Mbyte of Direct Memory Addressing Capability
- 24 Operand addressing Modes
- Bit, Byte, Word, and Block Move Operations
- 8 and 16 Bit Signed/Unsigned Arithmetic
  - Binary or Decimal
  - Multiply and Divide
- Bus-hold Circuitry Eliminates Pull-up Resistors
- Hardened SAJI IV CMOS Process
- Single 5V Power Supply
- Military Temperature Range

Description

The Harris HS-80C86RH high performance radiation hardened 16 bit CMOS CPU is manufactured using a hardened field, self-aligned silicon gate CMOS process. Two modes of operation, MINimum for small systems and MAXimum for larger applications such as multi-processing, allow user configuration to achieve the highest performance level. Full TTL compatibility and industry standard operation allow use of existing NMOS 8086 hardware and software designs.

Description

The HS-6504RH is a synchronous 4096 x 1 static CMOS RAM fabricated using the Harris Custom Integrated Circuits Division radiation hardened guard banded, self-aligned silicon gate technology. The device utilizes synchronous circuitry to achieve high performance and low power operation.

Latch-up free operation is achieved by the use of epitaxial starting material to eliminate the parasitic SCR effect seen in conventional bulk CMOS devices. On-chip latches are provided for addresses, data input and data output allowing efficient interfacing with microprocessor systems. The data output can be forced to a high impedance state for use in expanded memory arrays.

The HS-6504RH is a fully static RAM and may be maintained in any state for an indefinite period of time.

HARRIS

HS-6564RH

Radiation Resistant 8K x 8, 16K x 4 CMOS RAM

Preliminary

Features

LOW POWER STANDBY	500μW MAX
LOW POWER OPERATION	180mW/MHz MAX
DATA RETENTION	3.0 V MIN
TTL COMPATIBLE IN/OUT	
THREE STATE OUTPUTS	
FAST ACCESS TIME	250 nsec TYP.
MILITARY TEMPERATURE RANGE	-55°C TO +125°C
ON CHIP ADDRESS REGISTERS	
ORGANIZABLE 8K×8 OR 16K×4	
40 PIN DIP PINOUT 2.000″ × 0.900″	
FUNCTIONAL TOTAL DOSE	1×10^5 RAD Si
DATA UPSET	$>10^8$ RAD Si/SEC
LATCH-UP FREE TO	$>5\times10^{11}$ RAD Si/SEC

Description

The HS-6564RH is a radiation resistant 64K bit, synchronous CMOS RAM. It consists of 16 HS-6504RH 4K×1 radiation resistant CMOS RAMs, in leadless carriers, mounted on a ceramic substrate. The HS-6564RH is configured as an extra wide, standard length 40 pin DIP. The memory appears to the system as an array of 16 4K×1 static RAMs. The array is organized as two 8K by 4 blocks of RAM sharing only the address bus. The data inputs, data outputs, chip enables and write enables are separate for each block of RAM. This allows the user to organize the HS-6564RH RAM as either an 8K by 8 or a 16K by 4 array.

This 64K memory provides a unique blend of low power CMOS semiconductor technology and advanced packaging techniques. The HS-6564RH is intended for use in radiation environments where a large amount of RAM is needed, and where power consumption and board space are prime concerns. On-chip latches are provided for addresses, data input and data output allowing efficient interfacing with microprocessor systems. The data output can be forced to a high impedance for use in expanded memory arrays. The guaranteed low voltage data retention characteristics allow easy implementation of non-volatile read/write memory by using very small batteries mounted directly on the memory circuit board.

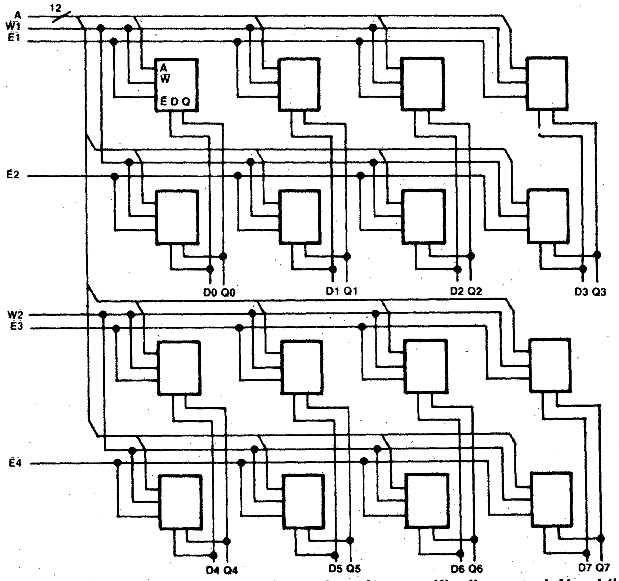
*VCC	20	21	GND*

***NOTES:**

Pins 20 and 40 (VCC) are internally connected. Similarly pins 1 and 21 (Ground) are connected. The user is advised to connect all four VCC pins and Ground pins to his board busses. This will improve power distribution across the array and will enhance decoupling.

Pin 10 is internally connected to pin 11, and pin 30 is connected to pin 31. For those users wishing to preserve board compatibility with possible future RAM arrays, we recommend connections to the write lines be made at pins 11 and 31, leaving pins 10 and 30 free for future expansion.

Functional Diagram



Information on this device is preliminary. Data is subject to change unless otherwise specifically agreed. No obligations are assumed for notice of change or future manufacture of this device.

CAUTION: These devices are sensitive to electronic discharge. Proper I.C. handling procedures should be followed.

CO2	Output Capacitance (16K × 4) ③		100			pF	f = 1MHz, VO = VCC or GND

NOTES:

① Each individual RAM in the leadless carrier is fully tested at worst case limits of temperature and voltage. The complete assembled HS-6564RH array is tested at room temperature only. The worst case parameters are guaranteed over the specified temperature and voltage ranges. Room temperature, 5 volt data is provided for information purposes and is not guaranteed.

② Operating supply current is proportional to operating frequency. ICCOP is specified at an operating frequency of 1MHz, indicating repetive accessing at a 1μs rate. Operation at slower rates will decrease ICCOP proportionally.

③ Capacitance sampled and guaranteed – not 100% tested.

④ Pre Radiation and Post Radiation limits.

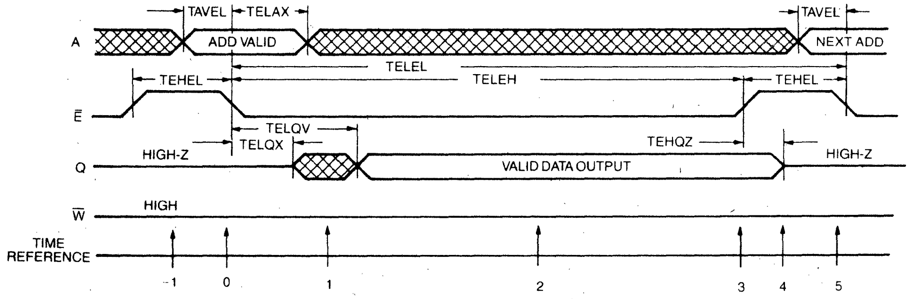
Read Cycle



TRUTH TABLE

TIME REFERENCE	INPUTS E̅	INPUTS W̅	INPUTS A	OUTPUT Q	FUNCTION
−1	H	X	X	Z	MEMORY DISABLED
0	↘	H	V	Z	CYCLE BEGINS, ADDRESSES ARE LATCHED
1	L	H	X	X	OUTPUT ENABLED
2	L	H	X	V	OUTPUT VALID
3	↗	H	X	V	READ ACCOMPLISHED
4	H	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS −1)
5	↘	H	V	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

The address information is latched in the on chip registers on the falling edge of E̅ (T = 0). Minimum address set up and hold time requirements must be met. After the required hold time, the addresses may change state without affecting device operation. During time (T = 1) the output becomes enabled but data is not valid until during time (T = 2). W̅ must remain high until after time (T = 2). After the output data has been read, E̅ may return high (T = 3). This will disable the output buffer and ready the RAM for the next memory cycle (T = 4).

1	L	X	X	X	Z	WRITE IN PROGRESS INTERNALLY
2	↗	X	X	X	Z	WRITE COMPLETED
3	H	X	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS −1)
4	↘	L	V	V	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

The early write cycle is the only cycle where the output is guaranteed not to become active. On the falling edge of $\overline{E}$ (T = 0), the addresses, the write signal, and the data input are latched in on chip registers. The logic value of $\overline{W}$ at the time $\overline{E}$ falls determines the state of the output buffer for that cycle. Since $\overline{W}$ is low when $\overline{E}$ falls, the output buffer is latched into the high impedance state and will remain in that state until $\overline{E}$ returns high (T = 2). For this cycle, the data input is latched by $\overline{E}$ going low; therefore data set up and hold times should be referenced to $\overline{E}$. When $\overline{E}$ (T = 2) returns to the high state, the output buffer disables and all signals are unlatched. The device is now ready for the next cycle.

TRUTH TABLE

TIME REFERENCE	INPUTS				OUTPUT	FUNCTION
	$\overline{E}$	$\overline{W}$	A	D	Q	
−1	H	X	X	X	Z	MEMORY DISABLED
0	↘	H	V	X	Z	CYCLE BEGINS, ADDRESSES ARE LATCHED
1	L	H	X	X	X	OUTPUT ENABLED
2	L	H	X	X	V	OUTPUT VALID, READ AND MODIFY TIME
3	L	↘	X	V	V	WRITE BEGINS, DATA IS LATCHED
4	L	X	X	X	V	WRITE IN PROGRESS INTERNALLY
5	↗	X	X	X	V	WRITE COMPLETED
6	H	X	X	X	Z	PREPARE FOR NEXT CYCLE (SAME AS −1)
7	↘	H	V	X	Z	CYCLE ENDS, NEXT CYCLE BEGINS (SAME AS 0)

The read modify write cycle begins as all other cycles on the falling edge of $\overline{E}$ (T = 0). The $\overline{W}$ line should be high at (T = 0) in order to latch the output buffers in the active state. During (T = 1) the output will be active but not valid until (T = 2). On the falling edge of the $\overline{W}$ (T = 3) the data present at the output and input are latched. The $\overline{W}$ signal also latches itself on its low going edge. All input signals excluding $\overline{E}$ have been latched and have no further effect on the RAM. The rising edge of $\overline{E}$ (T = 5) completes the write portion of the cycle and unlatches all inputs and output. The output goes to a high impedance and the RAM is ready for the next cycle.

NOTES: In the above descriptions the numbers in parenthesis (T = n) refer to the respective timing diagrams. The numbers are located on the time reference line below each diagram. The timing diagrams shown are only examples and are not the only valid method of operation.

Board Size Tradeoffs

Printed circuit board real estate is a costly commodity. Actual board costs depend on layout tolerances, density, complexity, number of layers, choice of board material, and other factors.

The following table compares board space for 16 standard DIP 4K RAMs to the HS-6564RH RAM array. Both fine line, close tolerance layout and standard "easy" layout board sizes are shown in the comparison.

64K ARRAY OF 16 4K RAMs ON A PC BOARD V.S. THE HS-6564RH

PACKAGE	CIRCUIT SUBSTRATE	SIZE
18 Pin DIP	Standard Two Sided PCB	12 to 15 sq. in.
18 Pin DIP	Fine Line or Multilayer PCB	9 to 11 sq. in.
18 Pin Leadless Carrier	Multilayer Alumina Substrate	3 to 5 sq. in.
HS-6564RH	Two Sided Mounting Multilayer Alumina Substrate	2 sq. in.

The cost of semiconductor circuits decline with time. If actual costs were included, they would be out of date in a very short time. We urge you to contact your local Harris office or sales representative for accurate pricing allowing cost tradeoff analysis. In your cost analysis, also consider the advantages of a lighter, smaller overall package for your system. Consider how much more valuable your system will be when the memory array size is decreased to about 1/6 of normal size.

Description

The HS-6551RH is a 256 by 4 static CMOS RAM fabricated using the Harris Programs Division radiation hardened self-aligned silicon gate technology. Synchronous circuit design techniques are employed to achieve high performance and low power operation.

On-chip latches are provided for addresses, allowing efficient interfacing with microprocessor systems. The data output buffers can be forced to a high impedance state for use in expanded memory arrays.

The HS-6551RH is a fully static RAM and may be maintained in any state for an indefinite period of time.

Radiation Hardened 16K x 1 CMOS RAM

Features

- Radiation Hardened EPI-CMOS
- Total Dose .... >2 x 10^5 Rad (Si)
- Transient Upset .... > 1 x 10^8 Rad (Si)/sec
- Latch-up Free .... > 2 x 10^{12} Rad (Si)/sec
- Single Event Upset Immune Option
- Electrically Equivalent to Sandia SA 3240
- Low Standby Current.................................... 200μA max
- Low Operating Current.......................... 6mA/MHz max
- Fast Access Time .... 100ns Typ.
- 16,384 x 1 Bit
- Single +5V Power Supply
- Asynchronous Operation
- CMOS or TTL Compatible Inputs
- Completely Static Operation
- Three-State Output
- -55°C to +125°C Operation
- Total Dose Capabilities above 2 x 10^5 Rad(Si) are available. Contact Factory for Details.

Description

The HS-65262RH was designed to be functionally compatible with the Harris HM-65262. It is an asynchronous 16,384 x 1 bit static CMOS RAM fabricated using the Harris Custom Integrated Circuits Division radiation hardened composite oxide, self-aligned junction isolated silicon gate technology. This technology completely eliminates the need for guard-bands. The device is designed to have a maximum access time of 150ns after exposure to 2 x 10^5 Rads (Si) over the full military temperature range. Latch-up free operation is achieved by the use of epitaxial starting material. In addition, the device has the option to be single event upset immune. Operation is designed for +5V. Contact factory for sample availability.

Features

- RADIATION HARDENED
- FIELD PROGRAMMABLE
- ELECTRICALLY EQUIVALENT TO HM-6641
- FUNCTIONAL TOTAL DOSE .... $1X10^5$ RAD(Si)
- LATCH-UP FREE .... > 1×10^{12} RAD(Si)/s
- LOW POWER STANDBY .... 500μW MAX
- LOW POWER OPERATION .... 50mW/MHz MAX
- FAST ACCESS TIME .... 250ns MAX
- POLYSILICON FUSE LINKS
- TTL COMPATIBLE IN/OUT
- POPULAR PINOUT LIKE BIPOLAR 7641
- THREE-STATE OUTPUTS
- ADDRESS LATCHES INCLUDED ON CHIP
- EASY MICROPROCESSOR INTERFACING
- -55°C TO +125°C OPERATION

Description

The Harris HS-6641RH is a radiation hardened 4K CMOS PROM, organized in a 512 word by 8 bits/ word format. The chip is manufactured using a radiation hardened CMOS process, and is designed to be electrically equivalent to HM-6641. Synchronous circuit design techniques combine with CMOS processing to give this device high speed performance with very low power dissipation.

On chip address latches are provided, allowing easy interfacing with recent generation microprocessors that use multiplexed address/data bus structures, such as the HS-80C85RH. The output enable controls, both active low and active high, further simplify microprocessor system interfacing by allowing output data bus control independent of the chip enable control. The data output latches allow the use of the HS-6641RH in high speed pipelined architecture systems, and also in synchronous logic replacement functions.

Applications for the HS-6641RH CMOS PROM include low power microprocessor based instrumentation and communications systems, remote data acquisition and processing systems, processor control store, and synchronous logic replacement. Contact factory for sample availability.

RADIATION HARDENED CMOS GATE ARRAYS

AUGUST 1985

Features

- 3 Micron CMOS technology
- Total dose: $>1 \times 10^5$ RAD Si
- Data upset: $>1 \times 10^8$ RAD Si/sec
- Latch-up free to: $>2 \times 10^{12}$ RAD Si/sec
- 600, 1200, and 2500 gate arrays
- 3ns typical gate delay
- 10 MHZ clock frequency
- 74LS-SSI, MSI library implemented
- TTL and CMOS compatibility
- Individually programmable I/O buffers
- Bi-directional and three state I/O's
- Military temperature range
- Multiple package options
- Total dose capabilities above 10^5 RAD Si are available. Contact factory for details.

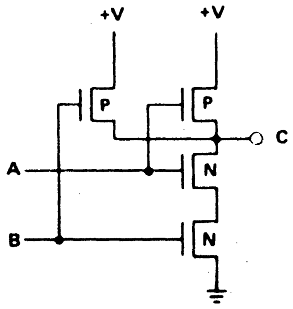
1 GATE EQUIVALENT



Description

Harris Custom Integrated Circuits Division Special Products Group offers a complete family of semi-custom radiation hardened logic. The HS-G0600RH, HS-G1200RH, and HS-G2500RH are three radiation hardened CMOS gate arrays. These gate arrays use the Harris HCA macro library of 74LS functions. The process utilizes 4um p-channel lengths, 3um n-channel lengths, and 3um minimum feature size.

The HARRIS system minimizes the amount of design and logic coding by offering a library of 74LS equivalent SSI and MSI function designs. There is no need to implement large MSI functions with primative gates.

Each function has a complete data sheet specifying propagation delays and A. C. parameters. A final software program verifies that the original logic description matches the finished artwork.

Each input-output buffer can be individually specified to be input, output, three-state, or bi-directional. CMOS or TTL compatibility can also be specified. The large number of I/O buffers keeps the input/output-to-gate ratio low, insuring that the design is not pin limited.

If your circuit becomes too complex, transition from HCA gate arrays to HCA standard cell is very simple. The same logic description files are used as input to an auto-router. Both HCA gate arrays and HCA standard cells utilize the same SSI, MSI 74LS macro library.

RH CMOS Gate Array Specifications

ABSOLUTE MAXIMUM RATINGS

Supply Voltage (V_{CC} − GND)	−0.3V to +8.0V
Input or Output Voltage Applied	(GND − 0.3V) to(V_{CC} + 0.3V)
Storage Temperature	−65°C to +150°C

OPERATING RANGE

Operating Supply Voltage	+4.75V to +5.25V
Operating Temperature	−55°C to +125°C

***CAUTION:** As with all semiconductors, stresses listed under "Absolute Maximum Ratings" may be applied to devices (one at a time) without resulting in permanent damage. This is a stress rating only. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. The conditions listed under "Electrical Characteristics" are the only conditions recommended for satisfactory operation.*

ELECTRICAL CHARACTERISTICS

$V_{CC} = 5.0V \pm 5\%$, T_A = Operating Temperature Range, (TYP Specs; $V_{CC} = 5.0V$, $T_A = 25°C$)

Description

Harris Semiconductor Custom Integrated Circuits Division (CICD) offers a radiation hardened standard cell library. The HD (high density) STANDARD CELL LIBRARY is a proven, high performance library. It is implemented using Harris Semiconductor's radiation hardened advanced CMOS process. This same mature process is being used to produce Harris radiation hardened gate arrays. This process uses 4um p-channel lengths, 3um n-channel lengths, and a minimum feature size of 3um. The library offers predesigned and precharacterized cells for which the user prescribes the interconnections in order to develop an application specific IC.

The library has a wide assortment of SSI primitive cells to optimize the design. The designer has the flexibility to define new cells to meet any unique requirements.

The library is supported by a design automation system. The software includes schematic capture, logic simulation, auto-place, auto-route, electrical and design rule verification. The system allows the user to perform the logic entry and simulation phases of the design process either at his own facility or at Harris with engineering support.

Package Options

Ceramic DIP	14-48 pins
Ceramic chip carrier (leaded)	68-84 pins
Ceramic chip carrier (leadless)	14-84 pins
Pin grid array (contact factory for current availability)	68-140 pins

RH Standard Cell Specifications

ABSOLUTE MAXIMUM RATINGS (Note 1 and 2)

Supply Voltage	−0.5V to 7.0V
Input/Output Voltage	VSS − 0.5V to VCC + 0.5V
Input Diode Current	10mA VI<0 or VI>VCC
Output Diode Current	10mA VO<0 or VO>VCC
Power Dissipation	1000mW
Continuous Supply Pin Current VCC or GND	100mA
Storage Temperature Ceramic	−65 to 150°C
Continuous Current per Output	10mA

OPERATING RANGE

Operating Supply Voltage +4.75 V to +5.25 V

Operating Temperature −55°C to +125°C

Notes:

1 Stresses beyond those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under RECOMMENDED OPERATING CONDITIONS is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

2 All applied voltages are with reference to ground (VSS).

Recommended Operating Conditions

D.C. ELECTRICAL CHARACTERISTICS

VCC = 5V ± 5% TA = Operating Temperature Range

SYMBOL	PARAMETER	INPUT TYPE	MIN	TYP	MAX	UNITS	TEST CONDITIONS
VCC	Operating Supply Voltage		4.75	5.0	5.25	V	
T_A	Operating Temperature		−55	25	125	°C

Description

The HSC-RH STANDARD CELL LIBRARY is a proven, high performance library. It is implemented using Harris Semiconductor's radiation hardened advanced CMOS process. This same mature process is being used to produce CICD's HS-GXXXXRH radiation hardened gate arrays. The minimum feature size is 2.5 microns with 2.5 micron N-channel lengths and 3.0 micron P-channel lengths. The library offers predesigned and pre-characterized cells and macros for which the user prescribes the interconnections in order to develop an application specific IC.

The library has a wide assortment of SSI primitive cells, plus a group of macros which are functionally identical to the standard functions provided by the 74XX series of integrated circuits. Also included is a set of LSI macros representing various highly integrated microprocessor peripheral and communication functions. The designer has the choice of intermixing cells or macros from any of the three groups to optimize his design implementation. The designer may choose the design method and group of functions that is most familiar to him.

The library is supported by a design automation system. The software includes schematic capture, logic simulation, auto-place, autoroute, electrical and design rule verification. If preferred, the system allows the customer to perform the logic entry and simulation phases of the design process either at his own facility or at Harris with engineering support.

Package Options

Ceramic DIP	14 - 48 pins
Ceramic chip carrier (leadless)	14 - 48 pins
Ceramic chip carrier (leaded)	64 - 84 pins
Pin grid array (contact factory for current availability).	68 - 140 pins

(Note 1 and 2)

Supply Voltage .... -0.5V to 7.0V
Input/Output Voltage .... VSS -0.5V
VDD +0.5V
Input Diode Current 10mA
VI< 0 or VI > VDD
Output Diode Current 10mA
VO < 0 or VO > VDD
Power Dissipation 1000mW
Continuous Supply Pin Current VDD or VSS 100mA
Storage Temperature .... -65 to 150°C
Continuous Current per Output 10mA

NOTES:

1. Stresses beyond those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under RECOMMENDED OPERATING CONDITIONS is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.
2. All applied voltages are with reference to ground (VSS).

Recommended Operating Conditions:

D.C. Electrical Characteristics: VDD 5V ± 5% T_A = Operating Temperature Range

SYMBOL	PARAMETER	TYPE	MIN	MAX	UNIT	CONDITIONS
VDD	Operating Supply Voltage		4.75	5.25	V	
T_A	Operating Temperature		-55	125	°C	
VIH	Input High Voltage	TTL	2.2		V	
		CMOS	70% VDD		V	
VIL	Input Low Voltage	TTL		0.8	V	
		CMOS		30% VDD	V	
II	Input Current					
	Standard		-1.0	+1.0	μA	VSS < VI < VDD
	Pull Up		-500	+1.0	μA	
	Pull Down		-1.0	+500	μA	
	Pull Up*		-50		μA	VI = 2.2
	Pull Down*			+50	μA	VI = 0.8
VOH	Output Voltage		2.4		V	IOH = -6.0mA
VOL	Output Voltage			0.4	V	IOL = 6.0mA
IOZ	Output Leakage		-10.0	+10.0	μA	VSS < VO < VDD HI-Z
CI**	Input Capacitance			7.0	pF	VI = VDD or VSS F = 1 MHz
CO**	Output Capacitance			10.0	pF	VO = VDD or VSS F = 1 MHz
CIO**	Input/Output Capacitance			15.0	pF	VO = VDD or VSS F = 1 MHz
IDDSB	Stand-By Supply			100	μA	VI = VDD or VSS II = 0; IO = 0

* Maximum input current for which specified VI will be maintained.

** Sampled and guaranteed but not 100% tested. These values may vary by package type.

Radiation Screen Procedure

1. Two (2) probed good samples per wafer will be selected from ≥ 20% of the wafers in a run. (All wafers in a "run" will have been processed together through all high temperature processing steps and through metallization.)
2. The sample die shall be assembled and tested to the customer's specification for proper operation.
3. The sample devices shall be subjected to a Total Dose Radiation level of 1 x 10^5 Rad-Si (±10%) from a Gamma Cell 220 Cobalt 60 source or equivalent. The samples shall be biased at 5 volts with all inputs high. The dose rate shall be between 50 rads/sec and 200 rads/sec.
4. The samples will be tested to the customer's specifications within one hour after irradiation. The lot will be accepted only if all units, exclusive of nonradiation failures, meet the specified limits.
5. Radiation screening to a higher total dose is available. Customers should contact the factory for details.

Radiation Effects

The HSC-CELL LIBRARY has been designed to survive in a radiation environment and to meet the electrical characteristics. Latchup free operation is achieved by the use of epitaxial starting material. Improved total dose hardness is obtained with special low temperature processing cycles. On a production basis, Harris performs screens for total dose hardness to a level of 1 x 10^5 Rad-Si. Transient radiation tests have shown the following results:

Latch-up free to doses > 2 x 10^{12} rads/sec.
Upset (loss of stored data) > 10^8 rads/sec.

HARRIS

Preliminary

HS-3516RH

High Slew Rate, Wideband, Radiation Resistant, Operational Amplifier

Features

- HIGH SLEW RATE . . . . >$\pm$22V/μs
- FAST SETTLING TIME 450ns
- WIDE POWER BANDWIDTH. 12MHz
- LOW OFFSET VOLTAGE. . . . . $\pm$5mV
- LOW POWER SUPPLY CURRENT 6.5mA
- SHORT CIRCUIT PROTECTION
- RADIATION ENVIRONMENT
  - NEUTRON FLUENCE (ϕ) 5×10^{12}n/cm^2 (E$\geq$10KeV)
  - GAMMA RATE ($\dot{\gamma}$) . . . . . 1×10^9 RADs Si/s
  - GAMMA DOSE (γ) . . . . . 1×10^6 RADs Si

Description

The HS-3516RH is a monolithic, high slew rate, wideband, radiation resistant, operational amplifier. It provides a bandwidth (unity gain stable) of greater than 10MHz and a slew rate in excess of 22V/μsec. Optional frequency compensation adjustment is provided. The HS-3516RH has an internal unity gain frequency compensation capacitor which is internally connected. A clamp node feature enables the user to clamp the output voltage via pin 3 which can source or sink up to 3mA for high frequency clamped switching purposes.

This device is designed to operate from -55°C to $+125^{o}$C and in strategic-level radiation environments.

HARRIS

HS-3530RH

Low Power-Radiation Resistant Programmable Operational Amplifier

Features

- WIDE RANGE AC PROGRAMMING
  - SLEW RATE 06 TO3V/μs
  - GAIN X BANDWIDTH . . . . 100KHz TO 5.0MHz
- WIDE RANGE DC PROGRAMMING
  - POWER SUPPLY RANGE . . . . ±1.5V TO ±18V
  - SUPPLY CURRENT . . . . 10μA TO 1.2mA
- SHORT CIRCUIT PROTECTION
- RADIATION ENVIRONMENT
  - NEUTRON FLUENCE(Φ) . 5 x 10^{12} n/cm^2 (E ≥ 10KeV)
  - GAMMA RATE($\dot{\gamma}$) . . . . 1 x 10^9 RADS (Si)/s
  - GAMMA DOSE(γ) . . . . 1 x 10^6 RADS (Si)

Description

The HS-3530 is a Low Power Operational Amplifier which is an internally compensated monolithic device offering a wide range of performance specifications. Parameters such as power dissipation, slew rate, bandwidth, noise and input DC parameters are programmed by selecting an external resistor or current source. Supply voltages as low as ±3 volts may be used with little degradation of AC performance. The HS-3530 has been specifically designed to meet exposure to radiation environments. Operation from −55°C to +125°C is guaranteed.

A major advantage of the HS-3530 is that operating characteristics remain virtually constant over a wide supply range (+3V to +15V), allowing the amplifier to offer maximum performance in almost any system, including battery operated equipment. A primary application for this device is in active filtering and conditioning for a wide variety of signals that differ in frequency and amplitude. Also, by modulating the set current, it can be used for designs such as current controlled oscillators/modulators, sample and hold circuits and variable active filters.

HS-5104RH

ADVANCE INFORMATION

September 1985

Radiation Hardened High Performance Quad Operational Amplifier

Features

- **Low Offset Voltage** **3.0mV**
- **High Slew Rate** **1.0V/μs**
- **Single 5V Supply Capability**
- **Radiation Environment**
  - **Neutron Fluence (φ)** .... **5×10^{12}n/cm^2 (E≥10KeV)**
  - **Gamma Rate ($\dot{\gamma}$)** .... **1×10^9 rad(Si)/s**
  - **Gamma Dose (γ)** .... **1×10^5 rad(Si)**

Applications

- **High Q, Active Filters**
- **Audio Amplifiers**
- **Instrumentation Amplifiers**
- **Integrators**
- **Signal Generators**

Description

The HS-5104RH is a radiation hardened, high performance, dielectrically isolated monolithic quad operational amplifier that combines superior performance with a high resistance to total dose and prompt gamma radiation as well as neutron bombardment. This general purpose amplifier offers an array of dynamic specifications ranging from a 1V/μs slew rate and a 60kHz full power bandwidth to an output drive current of 10mA.

Fabricated using special radiation hardening techniques developed at Harris, these amplifiers show almost no change in offset voltage and current after exposure to 100K rad(Si) gamma radiation, with only a minor increase in bias current. Complementing these specifications is a post radiation open loop gain in excess of 40K.

This impressive combination of features makes this amplifier ideally suited for a variety of applications such as active filter design, signal conditioning, and instrumentation circuits. Designed to meet exposure in radiation environments, this amplifier is a necessity for satellite, spacecraft, and nuclear power systems where its unique properties will prolong the useful life of a system.

This quad operational amplifier is available in an industry standard pinout allowing for immediate interchangeability with most other quad operational amplifiers.

Radiation Screening Procedure

(1) Two (2) probed good samples per wafer will be selected from ≥20% of the wafers in a run. (All wafers in a "run" will have been processed together through all high temperature processing steps and through metallization.)

(2) The sample die shall be assembled and tested for functionality.

(3) The sample devices shall be subjected to a Total Dose Radiation level of 1×10^5 rad(Si) ±10% from a gamma cell 220 cobalt 60 source or equivalent. The devices will be powered in the configuration illustrated with $V_{SUPPLY} = \pm 15V$. The dose rate shall be between 50 rad/sec and 200 rad/sec.

(4) AV_{OL}, V_{IO}, I_{BIAS}, and I_{IO}, with $V_{SUPPLY} = \pm 15V$, will be measured and recorded for each device within one hour after irradiation. The lot will be accepted only if the sample, exclusive of non-radiation failures, meets the limits of $AV_{OL} \geq 40K$, $V_{IO} \leq 3.0$ mV, $I_{BIAS} \leq 1\mu A$, and $I_{IO} \leq 300nA$ at room temperature.

Description

The HS-508ARH is a dielectrically isolated, radiation resistant, CMOS analog multiplexer incorporating an important feature; it withstands analog input voltages much greater than the supplies. This is essential in any system where the analog inputs originate outside the equipment. They can withstand a continuous input up to 10 volts greater than either supply, which eliminates the possibility of damage when supplies are off, but input signals are present. Equally important, it can withstand brief input transient spikes of several hundred volts; which otherwise would require complex external protection networks. Necessarily,ON resistance is somewhat higher than similar unprotected devices, but very low leakage current combine to produce low errors. Reference Application Notes 520 and 521, available from the Analog Products Division of Harris, for further information on the 508A multiplexer in general.

The HS-508ARH has been specifically designed to meet exposure to radiation environments. Operation from -55°C to $+125^{\circ}$C is guaranteed.

Description

The HS-1840RH is a radiation resistant, monolithic 16 channel multiplexer constructed with the Harris Linear Dielectric Isolation CMOS process. It is designed to provide a high input impedance to the analog source if device power fails (open) or the analog signal voltage inadvertently exceeds the supply rails during powered operation. Excellent for use in redundant applications, since the secondary device can be operated in a standby unpowered mode affording no additional power drain. But more significantly, a very high impedance exists between the active and inactive devices preventing any interaction. One of sixteen channel selection is controlled by a 4-bit binary address plus an Enable-Inhibit input which conveniently controls the ON/OFF operation of several multiplexers in a system. All digital inputs have electrostatic discharge protection.

The HS-1840RH has been specifically designed to meet exposure to radiation environments. It is available in a 28 pin dual-in-line package and is guaranteed operational from −55°C to +125°C.

HS-302RH/ 303RH/306RH/ 307RH/384RH/390RH

Radiation Hardened CMOS Analog Switches

Features

- Pin for Pin Compatible with Harris HI-3XX Series Analog Switches
- Analog Signal Range
- Low Leakage (Pre RAD Typical at 25°C) 90pA
- Low R_{ON} (Pre RAD Typical at 25°C) 30Ω
- Radiation Hardened
    - ▸ Functional Total Dose Exceeds 1 x 10^5 RAD Si
    - ▸ Low Leakage (Post RAD Typical at 25°C).......20nA
    - ▸ Low R_{ON} (Post RAD Typical at 25°C) 35Ω
- No Latch Up
- Break-Before-Make Delay (Typical)........................65ns
- Versions for 5V and 15V Digital Systems
- Full Military Temperature Range
- Low Operating Power

Applications

- Sample and Hold i.e. Low Leakage Switching
- Op Amp Gain Switching i.e. Low ON Resistance
- Portable Battery Operated Circuits
- Low Level Switching Circuits

Description

The HS-3XXRH family of analog switches are monolithic devices fabricated using CMOS technology and the Harris dielectric isolation process for latch-up free operation. These switches offer low-resistance switching performance for analog voltages up to the supply rails. "ON" resistance is low and stays reasonably constant over the full range of operating voltage and current. Switch impedance also changes very little over temperature. R_{ON} is nominally 30 ohms pre-RAD. All devices provide break-before-make switching.

The HS-302/303/384/390RH switches are for 5V digital systems and have a logic "0" condition with an input less than 0.8V and a logic "1" condition with an input greater than 4.0V. The HS-306/307RH switches are for 15V digital systems and have a low state with an input less than 3.5V and a high state with an input greater than 11.0V.

There are 6 devices in this switch series which are differentiated by type of switch action. All devices are available in ceramic DIP packages. The HS-3XXRH switches can directly replace the HI-3XX series devices.

* HS-302/303/384/390RH Only. ** HS-306/307RH Only. *** HS-303/307/390RH Only.

† The effects of radiation are quickly annealed at high temperatures, resulting in a return to normal operating parameters within minutes ; at low or normal temperatures, the annealing process takes several hours.

NOTES:

1. As with all semiconductors, stresses listed under "Absolute Maximum Ratings" may be applied to devices (one at a time) without resulting in permanent damage. This is a stress rating only. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability. The conditions listed under "Electrical Characteristics" are the only conditions recommended for satisfactory operation.
2. V_S = ±10V, I_{OUT} = -10mA On resistance derived from the voltage measured across the switch under the above conditions.
3. V_S = ±14V, V_D = ∓14V.
4. V_S = V_D = ±14V.
5. The digital inputs are diode protected MOS gates and typical leakages of 1nA or less can be expected.
8. V_{IN} = 4V (one input) (all other inputs = 0V)
9. V_{IN} = 0.8V (all inputs).
10. V_{IN} = 15V (all inputs).
11. V_{IN} = 0V (all inputs).
12. To drive from DTL/TTL circuits, pull-up resistors to +5V supply are recommended.

Description

The Harris HS-15530RH is a high performance, radiation resistant, CMOS device intended to service the requirements of MIL-STD-1553 and similar Manchester II encoded, time division multiplexed serial data protocals. This LSI chip is divided into two sections, an Encoder and a Decoder. These sections operate completely independent of each other, except for the Master Reset function.

This circuit provides many of the requirements of MIL-STD-1553. The Encoder produces the sync pulse and the parity bit as well as the encoding of the data bits. The Decoder recognizes the sync pulse and identifies it as well as decoding the data bits and checking parity.

This integrated circuit is fully guaranteed to support the 1MHz data rate of MIL- STD-1553 over both temperature and voltage while residing in a radiation environment. It interfaces with CMOS, TTL or N channel support circuitry, and uses a standard 5 volt supply.

HARRIS

HS-3182

ARINC 429 Bus Interface Line Driver Circuit

Features

- INPUTS T^2L AND CMOS COMPATIBLE
- ADJUSTABLE RISE AND FALL TIMES VIA 2 EXTERNAL CAPACITORS
- PROGRAMMABLE OUTPUT DIFFERENTIAL RANGE VIA VOLTAGE REFERENCE INPUT (V_{REF})
- POWER STROBE INPUT PERMITS LOW QUIESCENT POWER OF $<$ 20mW
- OUTPUTS ARE INHIBITED (0 VOLTS) IF DATA (A) AND DATA (B) INPUTS ARE BOTH IN THE "LOGIC ONE" STATE
- CAN OPERATE UP TO A 100 KILOBITS DATA RATE
- OUTPUT SHORT CIRCUIT PROOF AND CONTAINS OVERVOLTAGE PROTECTION
- DATA "A" AND DATA "B" SIGNALS ARE "AND'D" WITH CLOCK AND SYNC SIGNALS
- FULL MILITARY TEMPERATURE RANGE

Description

The HS-3182 ARINC 429 bus interface driver circuit is a monolithic dielectrically isolated bipolar differential line driver designed to meet the specifications of ARINC 429. This device is intended to be used with a companion chip, HS-3282 CMOS ARINC bus interface circuit, which provides the data formatting and processor interface function.

All logic inputs are T^2L and CMOS compatible. In addition to the DATA(A) and DATA(B) inputs there are also inputs for a CLOCK and SYNC signal which are AND'D with the DATA inputs. This feature was added to enhance system performance and to allow the HS-3182 to be used with devices other than the HS-3282. Also adding to system performance is the $\overline{\text{STROBE}}$ input. To minimize power consumption the $\overline{\text{STROBE}}$ input can be asserted to place the chip in the power-down mode where it draws substantially less current. Four power supplies are required; $+V = +15V \pm 10\%$, $-V = -15V \pm 10\%$, $V_1 = 5V \pm 5\%$ and V_{REF}. V_{REF} is used to program the output voltage swing, such that V_{OUT} (DIFF) $= \pm 2V_{REF}$. Typically, $V_{REF} = V_1 = 5V \pm 5\%$.

The driver output impedance is $75\Omega \pm 20\%$ at 25°C. Output rise and fall times are programmed through the use of two external capacitors, C_A and C_B. To meet the requirements for rise and fall times as specified in ARINC 429, $C_A = C_B = 75pF$ for the high speed operation (100 KBPS) and 500 pF for the low speed operation (12-14.5 KBPS). The outputs are protected against overvoltage and short circuit as shown in the Block Diagram. This device is designed to operate with a case temperature range of $-55°C$ to $+125°C$.

NOTES:

① Heat sink may be required for 100KBPS @ +125°C and output short circuit @ +125°C.
Thermal Characteristics: $T_{CASE} = T_{(Junction)} - \Theta_{(Junction-Case)} P_{(Dissipation)}$.

Where: $T_{(Junction\ Max)} = +175°C$
$\Theta_{(Junction-Case)} = 19.6°C/W$
$\Theta_{(Junction-Ambient)} = 86.5°C/W$

② Full Load for ARINC 429: $R_L = 400\Omega$ and $C_L = 30{,}000pF$ in parallel between A_{OUT} and B_{OUT}. (See Block Diagram).

③ Output Overvoltage Protection: The fuses used for output overvoltage protection may be blown by a fault at each output of greater than ±6.5V relative to GND.

HARRIS

HS-3282

CMOS ARINC Bus Interface Circuit

October 1985

Features

- ARINC Specification 429 Compatible
- Data Rates of 100 Kilobits or 12.5 Kilobits
- Separate Receiver and Transmitter Section
- Dual and Independent Receivers, Connecting Directly to ARINC Bus
- Serial to Parallel Receiver Data Conversion
- Parallel to Serial Transmitter Data Conversion
- Word Lengths of 25 or 32 Bits
- Parity Status of Received Data
- Generate Parity of Transmitter Data
- Automatic Word Gap Timer
- Single 5-Volt Supply
- Low Power Dissipation
- Full Military Temperature Range

Description

The Harris HS-3282 is a high performanca CMOS bus interface circuit that is intended to meet the requirements of ARINC Specification 429, and similar encoded, time multiplexed serial data protocols. This device is intended to be used with the HS-3182, a monolithic DI bipolar differential line driver designed to meet the specifications of ARINC 429. The ARINC 429 bus interface circuit consists of two (2) receivers and a transmitter operating independently as shown in Figure 1. The two receivers operate at a frequency that is ten (10) times the receiver data rate, which can be the same or different from the transmitter data rate. Although the two receivers operate at the same frequency, they are functionally independent and each receives serial data asynchronously. The transmitter section of the ARINC bus interface circuit consists mainly of a First-In First-Out (FIFO) memory and timing circuit. The FIFO memory is used to hold eight (8) ARINC data words for transmission serially. The timing circuit is used to correctly separate each ARINC word as required by ARINC Specification 429.

Even though ARINC Specification 429 specifies a 32-bit word, including parity, the HS-3282 can be programmed to also operate with a word length of 25 bits. The incoming receiver data word parity is checked, and a parity status is stored in the reciver latch and output on Pin BD08 during the 1st word. [A logic "0" indicates that an odd number of logic "1"s were received and stored; a logic "1" indicates that an even number of logic "1"s were received and stored]. In the transmitter the parity generator will generate either odd or even parity depending upon the status of PARCK control signal. A logic "0" on BD12 will cause odd parity to be used in the output data stream.

Versatility is provided in both the transmitter and receiver by the external clock input which allows the bus interface circuit to operate at data rates from 0 to 100 kilobits. The external clock must be ten (10) times the data rate to insure no data ambiguity.

The ARINC bus interface circuit is fully guaranteed to support the data rates of ARINC specification 429 over both the voltage (±5%) and full military temperature range. It interfaces with TTL, CMOS or NMOS support circuitry, and uses the standard 5-volt V_{CC} supply.

HUGHES MILITARY VLSI PRODUCTS

HCMOS GATE ARRAYS

Three HCMOS array families distinguished by 3 micron, 2 micron and VHSIC compatible processes featuring

- Wide ranging gate complexity
  - H-Series 1.2k to 8k gates
  - V-Series 1.2k to 8k gates
  - U-Series 1k to 40k gates
- Maximum 248 TTL or CMOS Input/output pins and over 16 mA drive capability per I/O
- Advanced design tools to accommodate easy placement and routing of advanced channelless structures
- Mentor or Daisy workstation support for efficient design development and convenient interface

MILITARY PRODUCTS AND SERVICES

STANDARD PRODUCTS/SERVICES

EEPROMs CMOS EEPROMs originated at Hughes. Electrically erasable/programmable non-volatile memory, low-power operation and in-circuit programming.

ROMs Full range of high density, mask programmable CMOS ROMs. Single voltage supply, low quiescent operating power. Industry standard and 1802 compatible control architectures.

1800 SERIES Full range of low-power microprocessors and peripherals.

LCD DRIVERS Industry's widest choice of CMOS liquid crystal drivers for both direct drive and multiplexed applications.

CUSTOMER-OWNED TOOLING Full service foundry. CMOS and PMOS processes. More than 25 variations. Select proximity, projection or DSW alignment techniques.

CUSTOM CIRCUITS

At the forefront of CMOS technology since the late 1960s, Hughes offers multiple CMOS processes, all available for custom circuit designs. Unique combinations of digital, analog and EEPROM may be included in a single chip. In-house capabilities include design, layout, mask making, wafer fabrication, assembly, test and screening.

High Performance 16K Static RAM MIL-STD-883C

IMS1400M

FEATURES

- Specifications guaranteed over full military temperature range (−55°C to +125°C)
- MIL-STD-883C Processing
- 45, 55 and 70nsec Chip Enable Access Times
- Maximum Active Power 660mW
- Maximum Standby Power 165mW
- Single +5V ± 10% Supply
- E̅ Power Down Function
- TTL Compatible Inputs and Output
- Fully Static—No Clocks for Timing
- Three-State Output

IMS1420M
IMS1423M

FEATURES

- Specifications guaranteed over full military temperature range (−55°C to +125°C)
- MIL-STD-883C Processing
- 4K x 4 Bit Organization
- Fully TTL Compatible
- Common Data Inputs & Outputs
- Single +5V ± 10% Operation
- Power Down Function
- 20 Pin, 300-mil DIP (JEDEC Standard)
- 660mW Maximum Power Dissipation

IMS1420M
- 55 and 70ns Address Access
- 55 and 70nsec Chip Enable Access
- 165mW Maximum Standby Power

IMS1423M
- INMOS Very High Speed CMOS—
- 45 and 55nsec Address Access Times
- 45 and 55nsec Chip Enable Access Times
- 100mW Maximum Standby Power
- 33mW Maximum Standby Power (Stable CMOS levels)
- Pin Compatible with IMS1420M

High Performance 64Kx1 Dynamic RAM MIL-STD-883C

FEATURES

- Specifications guaranteed over full military DRAM temperature range (−55°C to +110°C)
- MIL-STD-883 Processing
- High Speed, $\overline{\text{RAS}}$ Access of 120 and 150ns
- Cycle Times of 190 and 230ns
- Low Power:
  28mW Standby
  358mW Active (350ns Cycle Time)
  468mW Active (190ns Cycle Time)
- Single +5V ± 10% Power Supply
- On-Chip refresh using $\overline{\text{CAS}}$-before-$\overline{\text{RAS}}$, Pin 1 left as N/C for 256K expansion
- Indefinite D_{OUT} Hold Under $\overline{\text{CAS}}$ Control
- Industry Standard 16 Pin Configuration
- Nibble-Mode Capability (High Speed 4 Bit Serial Mode)
- 4ms/256 Cycle Refresh
- All Inputs and Output TTL Compatible
- Read, Write, Read-Modify-Write Capability both on Single Bit and in Nibble Mode Operation
- $\overline{\text{RAS}}$-Only Refresh Capability
- Common I/O Capability using "Early-Write"

*Selected devices are available with Level "S" screen. Call Micro Power Systems direct for availability.

Micro Power Systems provides selected standard products described in this catalog, as compliant Non-Jan devices, manufactured and tested in accordance with the requirements of MIL STD-883C and MIL-M38510F. Devices tested to Level B requirements are available as standard catalog items. MPS standard "/883" marking, dated 1 January 1985 or later, designates product that meets the requirements of MIL-STD-883, Level B.

MPS standard "883B" marking, dated 31 December 1984 or earlier, designates products that were produced to the requirements of MIL-STD-883B, Level B. Orders placed in 1984 specifying MIL-STD-883B, Level B, and inventory manufactured in this period are in accordance with MIL-STD-883B, Level B. Unless specifically requested otherwise, MPS will ship from /883B inventory using first-in, first-out inventory procedures.

Contact Micro Power Systems direct for a listing of currently available 883C products.

***Note:** For New Medium 20-Pin PAL Designs, only the "A" versions of these products are recommended. (See DESC No's 8103607 through 8103610.) Only the "A" versions of the medium PAL family are planned for JAN qualification by Monolithic Memories Inc., and will be more readily available for customer production needs over time.

[1] **Note:** Inactive for new designs for the R Case outline only. Use applicable QPL M38510 device.

[2] **Note:** The Military Products Division will be converting from the bottom brazed flatpack to a "W" package cerpack during 1985.

IMPORTANT NOTE—Part Number Interpretation
When ordering to JAN 38510 and DESC drawing numbers, the lead finish designator (last letter in part number) is commonly called out as "X". This is a way of stating that the customer will accept the standard manufacturer's lead finish for the package ordered. "X" *is not* a lead finish designator in itself, therefore, when product is shipped, the actual lead finish designator will be marked on the devices. At the present time, standard lead finishes on Monolithic Memories military products are as follows:

MMI Package Designator	Package Type	Standard Lead Finish	Mil-Spec Lead Finish Designator
J	Ceramic Dip	Solder Dip	A
F	Bottom Brazed Flatpack	Gold	C
W	Ceramic Flatpack	Solder Dip	A
L	Ceramic Leadless Chip Carrier	Gold	C

16,384 x 1-BIT DYNAMIC RAM
MKB4116(P/J)-82/83/84 MKB4116(E/F)-83/84
PROCESSED TO MIL-STD-883, METHOD 5004, CLASS B

FEATURES

☐ Extended operating temperature range ($-55\,°C \leq T_A \leq +110\,°C$)

☐ Recognized industry standard 16-pin configuration from Mostek

☐ 150ns access time, 320ns cycle (MKB4116-82)
200ns access time, 375ns cycle (MKB4116-83)
250ns access time, 410ns cycle (MKB4116-84)

☐ ±10% tolerance on all power supplies (+12, ±5)

☐ Low power: 462mW active, 30mW standby (max)

☐ Output data controlled by CAS and unlatched at end of cycle to allow two dimensional chip selection and extended page boundary

☐ Common I/O capability using "early write" operation

☐ Read-Modify-Write, RAS-only refresh, and Page-mode capability

☐ All inputs TTL compatible, low capacitance, and protected against static charge

☐ 128 refresh cycles (2msec refresh interval: −83, −84)

☐ Leadless chip carrier (E) and flat pack (F) available for high density applications, −83/84

☐ JAN version (MIL 38510/240)

DESCRIPTION

The MKB4116 is an MOS dynamic random access memory circuit organized as 16,384 words by 1 bit, providing wide operating margins, both internally and to the system user. The MKB4116 is fabricated using Mostek's double-poly, N-channel silicon gate, Poly I™ process. This process and the use of a single transistor dynamic storage cell provide the maximal circuit density and reliability, while maintaining high performance capability. The use of dynamic circuitry throughout, including sense amplifiers, minimizes power dissipation without sacrificing speed or operating margin. Multiplexed address inputs (a feature pioneered by Mostek for its 4K RAMs) permits the MKB4116 to be packaged in a standard 16-pin DIP. This package configuration is compatible with widely available automated testing and insertion equipment. Non-critical clock timing requirements allow use of the multiplexing technique while maintaining high performance.

PRELIMINARY

PROCESSED TO MIL-STD-883, METHOD 5004, CLASS B, 65,536 x 1-BIT DYNAMIC RAM MKB4564 (P/E) - 82/83/84

FEATURES

- ☐ Military temperature range: $-55°C \leq T_C \leq +110°C$
- ☐ Dynamic burn in at 125°C for 160 hours
- ☐ Recognized industry standard 16-pin configuration from Mostek
- ☐ Single +5 V (± 10%) supply operation
- ☐ On chip substrate bias generator for optimum performance
- ☐ Typical ordering information

MKB4564P-82 150 ns t_{RAC}
MKB4564P-83 200 ns t_{RAC}
MKB4564P-84 250 ns t_{RAC}

- ☐ Low power: 300 mW active, max
  22 mW standby, max
- ☐ Extended D_{OUT} hold using $\overline{CAS}$ control (Hidden Refresh)
- ☐ Common I/O capability using "early write"
- ☐ Read, Write, Read-Write, Read-Modify-Write and Page Mode capability
- ☐ All inputs TTL compatible, low capacitance, and protected against static charge
- ☐ Scaled POLY 5™ technology
- ☐ 128 refresh cycles (2 msec)
  Pin 9 is not needed for refresh

DESCRIPTION

The MKB4564 is the new generation dynamic RAM. Organized 65,536 words by 1 bit, it is the successor to the industry standard MKB4116. The MKB4564 utilizes Mostek's scaled POLY 5 process technology as well as advanced circuit techniques to provide wide operating margins, both internally and to the system user. The use of dynamic circuitry throughout, including the 512 sense amplifiers, assures that power dissipation is minimized without any sacrifice in speed or internal and external operating margins. Refresh characteristics have been chosen to maximize yield (low cost to user) while maintaining compatibility between dynamic RAM generations.

Multiplexed address inputs (a feature dating back to the industry standard MK4096, 1973) permit the MKB4564 to be packaged in a standard 16-pin DIP with only 15 pins required for basic functionality. The MKB4564 is designed to be compatible with the JEDEC standards for the 64K x 1 dynamic RAM.

The output of the MKB4564 can be held valid up to 10 μsec by holding $\overline{CAS}$ active low. This is quite useful since refresh cycles can be performed while holding data valid from a previous cycle. This feature is referred to as Hidden Refresh.

The 64K RAM from Mostek is the culmination of several years of circuit and process development, proven in predecessor products.

STANDARD MILITARY PRODUCT FLOWS

TABLE I details the screening and quality conformance inspection procedures for Motorola's standard military flows. Motorola has established two distinct product flows which are designed to meet the following applications:

1. **MOTOROLA JEDEC CLASS B FLOW:** Motorola JEDEC Class B products are offered for use in airborne or ground system applications. JEDEC product is screened and tested per the applicable requirements of MIL-M-38510, MIL-STD-883 including general provision paragraph 1.2 (and subordinate paragraphs), and applicable DESC drawing. Marking shall be in accordance with JEDEC Publication No. 101. Fabrication, screening and testing are not restricted to U.S.A. facilities.
2. **MIL-M-38510 JAN CLASS B FLOW:** JAN Class B products are offered for use in airborne or ground system applications. Fabrication, screening and testing are restricted to DESC certified lines.

CLASS B FLOW(S): The Class B flow has become the "Industry standard flow." This product receives all the 100% screening tests specified by Method 5004, MIL-STD-883. These tests include *visual inspection* to the requirements of Condition B of Method 2010 (and Method 5004 paragraph 3.3), *burn-in*, Condition A, B, C, D or E per Method 1015, for 160 hours at + 125° (or equivalent per Table I or Method 1015), and *static electrical testing at high and low rated temperatures.*

1/Alternate screens per Paragraph 3.3 of Method 5004, MIL-STD-883 will be used on bipolar digital logic and memory product.
2/For packages with cavity perimeter of >2 inches or a package mass >5 grams, lesser stress levels will be used.
3/See "Test Program" column in the Cross Reference Charts of Sections 3, 4, 5, 6 and Note 2 page 12 of IC Military Handbook (BR149), free upon request from Motorola Literature Center, P.O. Box 20912, Phoenix, AZ 85036.
4/Burn-in time/temperature per Table I of Method 1015, MIL-STD-883. PDA per method 5004, MIL-STD-883.
5/Sample size selection per 12MRM 03627A (sample sizes and acceptance levels are tighter than the requirements of Table I of Method 5005, MIL-STD-883).
6/Each package and lead finish for each week of seal for each assembly location.
7/JAN generic data may be used. If JAN generic data is not available, Group C inspection shall be periodically performed per general provision paragraph 1.2.1 of MIL-STD-883.
8/Group D inspection shall be periodically performed per general provision paragraph 1.2.1 of MIL-STD-883.
9/Endpoint electrical endpoints for Group(s) C and D inspection shall be subgroups 1, 2, & 3 of the applicable device specification.
10/When limits are available per applicable device specification. For SSI Class B devices, tests are performed as a part of Group C. For MSI and greater complexity Class B devices, tests are performed as a part of Group A.
11/Lead Finish "A" applied after completion of subgroup A_1, electrical tests.

1/The criteria for Linear MPO Metal Can products shall be as follows:
In all cases for flush mounted devices, the solder dip shall extend to 20 mils maximum or one lead width maximum, whichever is greater, from the seating plane or the glass seal of the package.

2/Motorola standard lead finish for JAN product is as follows:
All Cerdip: Fused matte tin (Lead Finish B), conversion is planned for lead finish "A" in third quarter 1985.
All Flat-Pack: Hot solder dip (Lead Finish A)
All LCCC: Gold (Lead Finish C)

3/Motorola standard lead finish for JEDEC product is as follows:
All Cerdip: Hot solder dip (Lead Finish A).
All Flat-Pack: Currently non-fused matte tin (Lead Finish B).
Conversion to Lead Finish A is planned by the end of the third quarter 1985.
All LCCC: Gold (Lead Finish C).
TO-66: Gold (Lead Finish C) or Hot solder dip (Lead Finish A).
All other cans: Hot solder dip (Lead Finish A).

STANDARD MILITARY PRODUCT MARKING

MINIMUM MARKING REQUIREMENT: All Motorola standard military product receives the following marking:

1. Motorola Symbol (logo): Example — Ⓜ
2. Seal Date Code (per MIL-M-38510): Example — 8511
3. ESD Identifier, Equilateral Triangle: Example — △
4. Device Part Number: Example — as shown in Table II
5. Index Point (defines starting point for numbering leads and/or mechanical orientation and shall consist of either a pin 1 dot, package notch or a dog-leg or pin 1 terminal).
6. Motorola's manufacturer's designating symbol CGG per NAV-SHIPS 0967-190-4010.
7. If package material contains beryllium oxide, the part is marked with the designator "BeO".

ADDITIONAL MARKING:

JEDEC product also receives the following marking:

a. Multiple part numbers (when applicable) as defined below:
   - — MOTOROLA JEDEC part number
   - — DESC DRAWING part number (if applicable).

b. Country of Origin (marked on backside of CERDIP, CERFLAT, and LCCC package types and on the side or bottom of "Metal Can" packages).

   NOTE: A unique prefix code may be added to the Inspection Lot Identification Code (seal date) which identifies the country of origin for both assembly and test. See table below.

c. "883" MIL-STD-883 General Provisions paragraph 1.2.1 compliance marking.

LOCATOR CODES FOR ASSEMBLY OR TEST

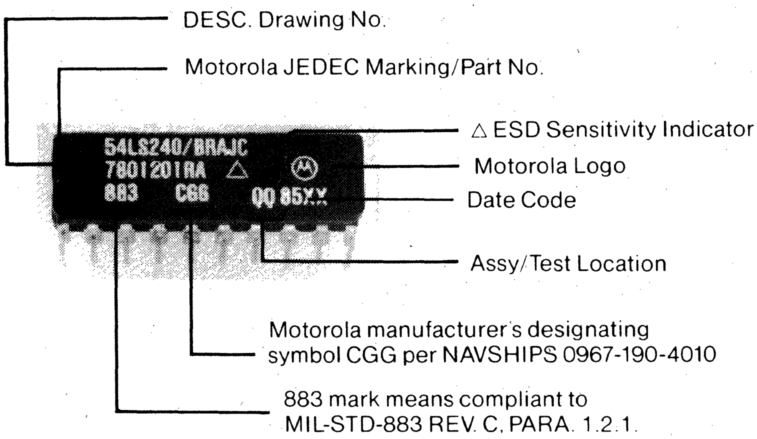
D — Austin, TX
I — Anam, Korea (Contractor)
K — Seoul, Korea (MKL)
L — Hong Kong
M — Mesa, AZ
Q — Kuala Lumpur, Malaysia (KLM)

R — Seremban, Malaysia
T — France
W — Guadalajara, Mexico
Y — Tempe, AZ
Z — Scotland

The prefix letter closest to the date code is the Test Location Code. The letter to the left of the Test Location Code is the Assembly Location Code.

Example:

K Y 85XX B
— Lot Designator
— Seal Date Code
— Test Location — Tempe, Arizona
— Assembly Location — Seoul, Korea



DESC. Drawing No.
Motorola JEDEC Marking/Part No.
54LS240/BRAJC
7801201RA △ Ⓜ
883 CGG QQ 85XX
△ ESD Sensitivity Indicator
Motorola Logo
Date Code
Assy/Test Location
Motorola manufacturer's designating symbol CGG per NAVSHIPS 0967-190-4010
883 mark means compliant to MIL-STD-883 REV. C, PARA. 1.2.1.

Commercial Product Processing Levels

The "Better" Program

Motorola's reliability enchancement program was developed to provide improved levels of reliability for standard commercial products.

THE "BETTER" program is offered on MOS, Linear, ECL, TTL, LS-TTL, DTL and HTL in dual-in-line ceramic and plastic packages.

Motorola standard commercial integrated circuits are manufactured under stringent in-process controls and quality inspections combined with the industry's finest outgoing quality inspections. The "BETTER" program offers three levels of extra processing, each tailored to meet different user needs at nominal costs.

The program is designed to:

- Eliminate incoming electrical inspection
- Eliminate need for independent test labs and associated extra time and costs
- Reduce field failures
- Reduce service calls
- Reduce equipment downtime
- Reduce board and system rework
- Reduce infant mortality
- Save time and money
- Increase end-customer satisfaction

BETTER PROCESSING - STANDARD PRODUCT PLUS:

100% SCREEN	LEVEL I "S"	LEVEL II "D"	LEVEL III "DS"
TEMP CYCLE, 10 CYCLES -65°C to +150°C	X		X
BURN-IN —		X	X
POST BURN-IN ELECTRICAL[2]		X	X
100°C FUNCTIONAL [1]	X		X
DC PARAMETRIC AT 25°C [1&2]	X	X	X

1. ECL and TTL/LS do functional and dc 100% at T_A Max (Levels I and III, 25°C or T_A Max optional for Level II.)
2. NMOS does Functional and dc 100% at 100°C.

"BETTER" AQL GUARANTEES

TEST	CONDITION	AQL*		
		LEVEL I	LEVEL II	LEVEL III
HIGH TEMPERATURE FUNCTIONAL	T_A = 100°C or T_A Max	.021		.021
DC PARAMETRIC	T_A = 25°C	.021	.021	.021
DC PARAMETRIC	T_A Min, TA MAX	.044	.044	.044
AC PARAMETRIC	T_A = 25°C	.044	.044	.044
DYNAMIC TEST (LINEAR AND NMOS)	T_A = 25°C	.044	.044	.044
EXTERNAL VISUAL AND MECHANICAL	MAJOR/MINOR	.065	.065	.065
HERMETICITY (NOT APPLICABLE TO PLASTIC PACKAGES)	GROSS/FINE	.15	.15	.15

"AQL" values shown are for reference only. "LTPD" type sampling plans that are equal to or tighter than values indicated may be used. Also, the guaranteed electrical and visual/mechanical AQL levels have been progressively tightened. Contact your nearest Motorola sales office for current values.

HOW TO ORDER

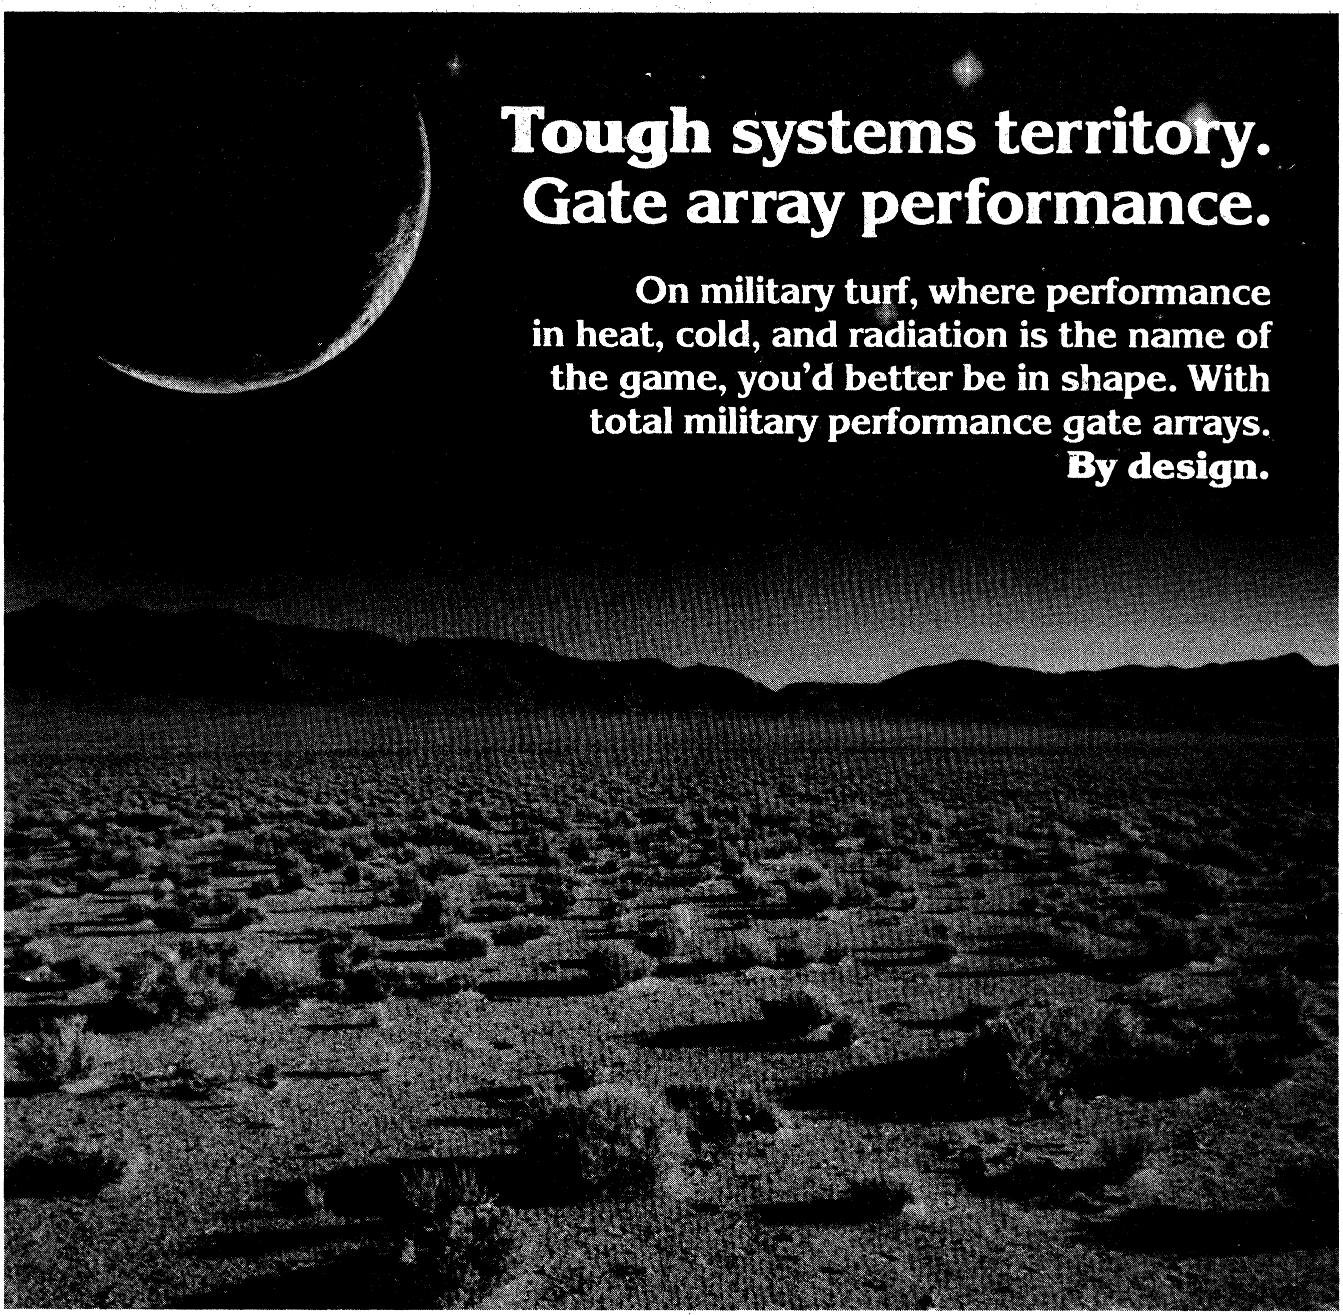
MC14001B — **Part Identification**

CP — **Standard Package Suffix**

S — **BETTER PROCESSING**
LEVEL I = SUFFIX S
LEVEL II = SUFFIX D
LEVEL III = SUFFIX DS

PART MARKING

The Standard Motorola part number with the corresponding "BETTER" suffix can be ordered from your local authorized Motorola distributor or Motorola sales offices. "BETTER" pricing will be quoted as an adder to standard commercial product price.



Tough systems territory.
Gate array performance.
On military turf, where performance in heat, cold, and radiation is the name of the game, you'd better be in shape. With total military performance gate arrays.
By design.

☐ **Raytheon Semiconductor Division designs for military performance:** Refined bipolar technology designed from scratch expressly for high speed, low power and radiation tolerance over the full military operating temperature range. Double the speed and half the power of LS. Documented radiation hardness.

☐ **Service and support:** Complete in-house integration of design and manufacturing. Fully automated CAD (including conversion from logic simulation to placement and routing, linkage between logic simulator and tester).

☐ **Credentials:** Trident II, Milstar, F-111, F-15, F-16, F-18, B-1, SICBM, JTIDS, AIM-7M, Patriot, ALQ 135 and other programs.

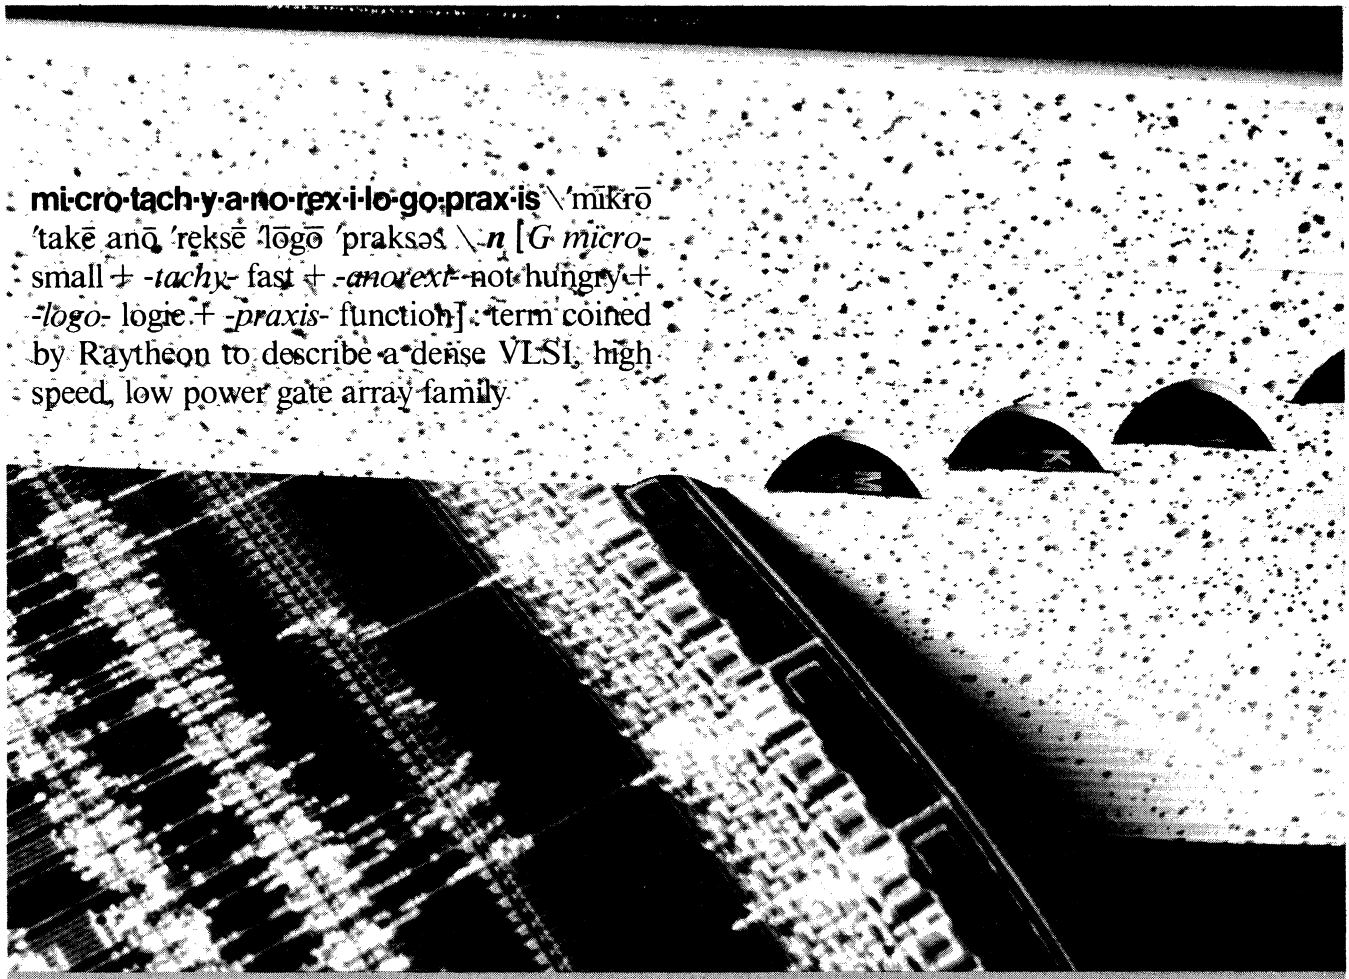
☐ **Advanced technology:** Five array densities from 800 to 2400 gates. Efficient Integrated Schottky Logic (ISL) bipolar technology. 2.3nS, 350μW (typ) gate performance . . . for 0.8pJ speed-power product. Selective enhancement to 1.8nS.

☐ **Call Raytheon Semiconductor Division:** Specifications, application notes, technical and cost proposal for your application. **415/966-7716.**

Raytheon

The Latest Word in Gate Arrays:

Microtachyanorexilogopraxis



mi·cro·tach·y·a·no·rex·i·lo·go·prax·is \ˈmīkrō ˈtakē anō ˈreksē ˈlōgō ˈpraksəs \ *n* [*G micro-* small + *-tachy-* fast + *-anorexi-* not hungry + *-logo-* logic + *-praxis-* function] : term coined by Raytheon to describe a dense VLSI, high speed, low power gate array family

And a few words of explanation.

Raytheon introduces a family of advanced Oxide-Isolated bipolar gate arrays combining density, high speed, low power consumption, and Integrated Schottky Logic. The 5,040 gate, 150 I/O, CGA 50L15. The 3,584 gate, 124 I/O, CGA 35L12.

☐ **High performance:** 1.2nS, 160μW (typical) gate performance for <0.2pJ speed-power product. Selective enhancement to 1.0nS. (Runs twice as fast as CMOS, without severe loading degradation. And total chip dissipation <1.5W at top speed.) Full military performance, radiation hardness.

☐ **Flexible service and support:** complete integration of design and manufacturing eliminates gate array anxieties. Fully automated CAD (including conversion from logic simulation to placement and routing, linkage between logic simulator and tester). Flexible customer interface points, program manager support.

You have our words on bipolar gate arrays, redefined. We'd like to get the word on your application.

High-Reliability Products

High-Reliability IC Capability

RCA Solid State is a leading supplier of high-reliability integrated circuits to the military and aerospace community. Years of commitment, dedication, experience, and know-how make possible shipment of hundreds of thousands of quality high-reliability microcircuits annually.

RCA specialists fully understand the needs of component and systems engineers in the design of high-reliability equipment, are thoroughly familiar with the objective and requirements of MIL-STD-883 and MIL-M-38510, and work closely with governmental agencies in the establishment of detailed specifications for high-reliability microcircuits. Moreover, RCA provides complete facilities for processing and testing integrated circuits to these specifications. RCA is justly proud of its many significant accomplishments with respect to the development, production, and shipment of high-reliability integrated circuits, including:

- First supplier of MIL-M-38510 to attain QPL Class S Part One Radiation-Hardness Listing
- First supplier of MIL-M-38510 CMOS integrated circuits
- Leader in the production of radiation-resistant CMOS microcircuits [to JAN 1×10^5 rad (Si) and 1×10^6 rad (Si)]
- Initiator of scanning-electron-microscope (SEM) inspections in the production of high-reliability microcircuits — in use at RCA since 1972
- Initiator of MIL-STD-883, Condition A inspections — in use at RCA since 1972

Reliability Classes

The term *high reliability* as applied to integrated circuits covers a broad spectrum of reliability classes. These classes were originally defined by device manufacturers based on test methods described in MIL-STD-883, a compendium of quality and conformance tests, and later were standardized by the government. MIL-STD-883 establishes uniform methods and procedures for testing microcircuits including basic environmental tests to determine resistance to deleterious effects of natural elements and conditions surrounding military and space operations and physical and electrical tests.

Today, there are both in-house and government-defined reliability classes. The contents of the in-house programs vary with the manufacturer. The government program, referred to as JAN M38510, consists of a General Specification and a Device (detailed) Specification. The General Specification, MIL-M-38510, establishes the general requirements for microcircuits and the quality and reliability assurance requirements that must be met in the procurement of JAN microcircuits. The Device (detailed) Specification establishes the detailed test requirements and inspections and any specific characteristics unique to the particular device. The General Specification applies to all technologies, such as TTL, ECL, Linear, and CMOS; the Device (detailed) Specification delineates the requirements for a circuit function within a device technology.

Standard-Product High-Reliability IC's

RCA offers high-reliability versions of virtually its entire line of standard-product integrated circuits from the CD4000 series of CMOS digital logic types, the CD54HC and CD54HCT high-speed CMOS types, the CDP1800 series of microprocessor and associated memory and input/output (I/O) types, and the CA3000 series of bipolar linear types. These integrated circuits are processed and screened to Class B requirements.

RCA also offers high-reliability versions of standard-product types that are processed and screened to special customized specifications, especially for the aerospace user and others who procure types to Class S specifications.

RCA maintains an extensive computer file of customer specifications and has the methodology required to translate these customized specifications into internal RCA standards and factory operating procedures. In addition to the detailed device specifications, the computer file lists the customer specification number, any revision number, and the RCA custom number assigned to a specific device type.

High-Reliability Custom and Semicustom IC's

RCA has complete custom- and semi custom-circuit capabilities for various CMOS and bipolar integrated-circuit technologies. Custom circuits are offered whenever this approach to integrated-circuit design is determined to be economically feasible. RCA high-reliability custom integrated circuits can be processed and screened to Class S or Class B specifications. These custom circuits, which are described in detail in later sections of this booklet include:

- EPIC 8-bit slice microcomputer family and associated memory (RAM) complement
- Semi-custom products —
  Automated gate arrays
  Automated standard cells (PaCMOS®)

Radiation-Hardened High-Reliability IC's

RCA also offers radiation-hardened versions of high-reliability (Class S and Class MS) CD4000-series CMOS integrated circuits. Radiation-hardened types, which are identified by addition of an "R" or "H" suffix to the device type number, are electrically and mechanically identical to their prototype with the exception that they are processed and screened to withstand a total gamma-radiation dosage of 10^5 rads(Si) for R-suffix types or 10^6 rads(Si) for H-suffix types. RCA also offers a broad line of radiation-hardened integrated circuits that utilize CMOS/SOS technology and provide exceptional tolerance for withstanding transient radiation, total-dose radiation, and single-event-upset (SEU). The device complement includes the EPIC 8-bit-slice microcomputer chip-set family, which contains an 8-bit slice, RAMs, ROMs, controllers, and semicustom gate arrays for customizing computer architecture or emulating existing software. Rad-hard RAMs are available for stand-alone memory systems. These devices are screened to military Class S-type specifications.

High-Reliability Products

JAN M38510 CD4000-Series CMOS ICs

The purpose of the JAN M38510 program is to achieve standardization among integrated-circuit suppliers and to assure delivery of devices whose long-term life will satisfy the requirements of the system for which they were intended.

Two reliability classes — S and B — are described in MIL-M-38510; the screening classes are performed according to MIL-STD-883, method 5004. Class S devices are of the highest reliability level and are intended for critical applications where replacement of components is not practical.

The Qualification and Quality Conformance Inspection tests delineated in MIL-STD-883 Method 5005 consist of:

Groups A and B — device electrical and mechanical construction evaluation tests respectively.

Groups C and D — accelerated stress tests that subject devices to stress levels greater than those normally experienced in a typical application.

Group A consists of electrical tests defined by the Device specification. (MIL-STD-883 Method 5005)

Group B (Class B) consists of Package and Internal Mechanical Strength tests. (MIL-STD-883 Method 5005)

Group B (Class S) consists of Package and Internal Mechanical Strength and Long-Term Reliability tests. (MIL-STD-883 Method 5005)

Group C (Class B only) consists of Chip-Related Long-Term Reliability tests. (MIL-STD-883 Method 5005)

Group D consists of Package and Construction Environmental tests. (MIL-STD-883 Method 5005)

Group E Radiation Hardness Verification Testing. (MIL-STD-883 Method 5005)

Qualification Inspection Tests (QI) are those tests defined by MIL-M-38510 as required for initial qualification of a device or package type to a given reliability class. Quality Conformance Inspection (QCI) Tests are those tests defined by MIL-M-38510 to evaluate production line quality of qualified devices. QCI tests are an on-going inspection process performed at periodic intervals defined by MIL-M-38510. QCI testing is the foundation of statistical process evaluation. Electrical end-point test limits are defined by MIL-M-38510 and are more demanding of CMOS than of TTL in areas of quiescent current and input leakage current. DC and AC parameters are measured at -55°C, +25°C and +125°C.

CD4000B Slash-Series CMOS High-Voltage ICs

The RCA high-reliability CD4000B series of high-voltage CMOS integrated circuits consists of a broad range of SSI, MSI-1, and MSI-2 (LSI) functions from simple gates to complex counters, registers, and arithmetic circuits. Specific design features for CMOS devices and the performance advantages of CMOS technology — low power consumption, high noise immunity, high speed, high fanout, TTL and DTL logic compatibility, excellent temperature stability, and fully protected inputs and outputs —provide the logic system designer with a capability to achieve outstanding performance, high reliability, and simplified circuitry in a wide variety of equipment designs.

Features

- 100% tested for quiescent current at 20V
- Maximum input current (leakage) of $1\mu A$ at 18 V over full package-temperature range; 100 nA at 18 V at 25°C
- Standardized symmetrical output characteristics
- 5-V, 10-V, and 15-V parametric ratings
- Noise margin (over full package-temperature range): 1 V at V_{DD} = 5 V, 2 V at V_{DD} =10 V, 2.5 V at V_{DD} = 15 V
- Meets all requirements of JEDEC Standard No. 13B, "Standard Specifications for description of 'B' Series CMOS Devices"

CA3000 Slash-Series Linear ICs and MOSFETs

RCA-CAXXXX "Slash" (/) Series types are high-reliability linear integrated circuits intended for applications in aerospace, military, and industrial equipment. These devices are electrically and mechanically identical to the standard types described in commercial databook SSD-240B entitled "Linear Integrated Circuits and MOS/FET's", but are specially processed and tested to meet the electrical, mechanical, and environmental test methods and procedures established for microcircuit devices.

RCA CA3000 slash/series types are supplied to three screening levels (/1, /3, and /3W) that meet the electrical, mechanical, and environmental test methods and procedures established for microelectronics in MIL-STD-883.

Radiation Effects on Linear ICs

There is no dedicated process for radiation hardening of the Linear ICs. Gammacell exposure of various devices representing both the bipolar and BiMOS wafer technologies has resulted in information useful for design guidance when considering radiation hardness.

Devices processed under bipolar technologies tend to withstand Gamma radiation to exposure levels of 1 x 10^5 rads(Si) prior to experiencing significant parameter degradation, while those processed with BiMOS techniques can withstand Gamma Ray exposure levels up to 1 x 10^4 rads(Si) before parameter degradation takes place. RCA does not guarantee rad-hard levels for linear IC's but will conduct rad-hard testing on a custom basis.

High-Reliability Products

QMOS 54HC/HCT Slash-Series CMOS ICs

The RCA QMOS 54HC/HCT series of high-speed CMOS logical integrated circuits include an extensive line of products that are pin compatible with many existing bipolar 54LSTTL and CMOS 4000 series of digital logic types. The new 54HC/HCT IC's provide high-speed CMOS replacements for the most popular LSTTL devices in existing designs and also offer low-power all-CMOS designs for new digital systems. Key family features of the RCA 54HC/HCT types include:

- Speeds equivalent to LSTTL types with typical gate delays of 10 ns.
- Fanout to 10 54-LSTTL loads; 15 loads using Bus Driver 54 types.
- Operating frequencies equivalent to LSTTL types, typically 30 MHz.
- The high-voltage noise-immunity characteristic of CMOS, typically 45 percent of V_{CC}, a two to three times improvement over LSTTL.
- Wide range of power supply operating voltages, 2 to 6 volts.
- CMOS low static power consumption, typically less than 1 microwatt.

With the broad line of CMOS MSI-function types currently available, together with performance offered by the RCA 54HC/HCT series of high-speed CMOS integrated circuits, the designer need not sacrifice speed for power consumption. Add the other classical advantages of CMOS, including high noise immunity and wide power-supply and temperature ranges, and the decision to use high-speed CMOS logic is the choice for the 80's. This new family provides for the design of more cost-effective systems to serve high-speed market applications.

The RCA 54HC/HCT high-reliability product line consists primarily of CD54HC-series types, which feature CMOS input-voltage-level compatibility, and CD54HCT-series types, which are input-voltage-level compatible with LSTTL devices. The 54HC/HCT high-reliability line also includes a limited number of single-stage, unbuffered inverter types (CD54HCU-series) for added versatility in oscillator and amplifier applications.

8-Bit CMOS Slash-Series LSI ICs

The RCA 1800 series is ideally suited for military applications such as mobile ground equipment that must be battery operated and exposed to harsh environments. Use of a highly-reliable, all CMOS LSI technology provides low power operation throughout the military temperature range.

The 'Slash 3' suffix following the type designation indicates that the devices are screened to military specifications as described in the screening sequence.

Features:

- Low power consumption
- Fully static
- Single power supply
- Full temperature range
- High noise immunity
- Complete family which includes RAMs, ROMs, and I/Os
- Leadless-chip-carrier packaging option for selected types
- Full CMOS CDP1802A microprocessor

Custom/Semicustom Slash-Series Devices

RCA has developed an extensive and rapidly growing custom and semicustom circuit capability. Most of these devices can be screened to RCA /3 criteria. These include devices fabricated using gate-array and standard-cell (RCA PaCMOS®) design techniques in a variety of CMOS technologies. A variety of packaging is available.

Special radiation-hardened semicustom circuits can be fabricated using the RCA radiation-hardening CMOS silicon-on-sapphire technology. These devices can be screened up to the RCA /1R criteria for space applications.

RCA has high-reliability capabilities in:

- Gate Arrays (Automated)
  - PA40000 (3µ Bulk Si Gate CMOS)
  - PA60000 (4µ Si gate rad-hard CMOS/SOS)
- PaCMOS standard-cell families
  - CMOS/SOS (4µ and 3µ)
  - CMOS II (3µ)

High Speed CMOS

Texas Instruments Military High-Speed CMOS logic family offers a broad range of functions, from gates to complex functions. TI's new generation of CMOS (High-Speed CMOS or HC) uses a 3 μm, self-aligned poly-silicon gate CMOS process. The net results of this process are higher gate densities, lower power consumption and an improvement in switching speeds.

Designed as a low power replacement family for Low Power Schottky TTL, 80 percent of the defined HCMOS functions are pin-out compatible with equivalent TTL functions while 10 percent are pin-out compatible with Series 4000 CMOS functions. The remaining 10 percent are newly defined HCMOS functions.

Two versions of High-Speed CMOS are available, HC and HCT. The HC series contains approximately 80 percent of the defined CMOS functions and is primarily intended for new designs. The HCT series consists of TTL-threshold compatible devices and was designed as a pin for pin replacement for LSTTL. The HCT series is primarily used in retrofit, intermixed with TTL in a system and bus interfacing.

HCMOS Speed/Power

The HCMOS family operates at speeds comparable with Low Power Schottky and with a 12 X improvement over Series 4000 CMOS. In terms of power consumption, HCMOS is frequency dependent whereas LS is flat to approximately 1 MHz. Beyond 1 MHz the power consumption of LS also becomes frequency dependent. Therefore, HCMOS consumes less power on a device type basis as shown in Figure 1. HCMOS offers a 14 X improvement over LSTTL in the speed/power product area. This gives designers a tremendous advantage in system power savings while maintaining the same performance level of Low Power Schottky. In addition, this power savings makes battery and battery back-up operation possible for many applications.

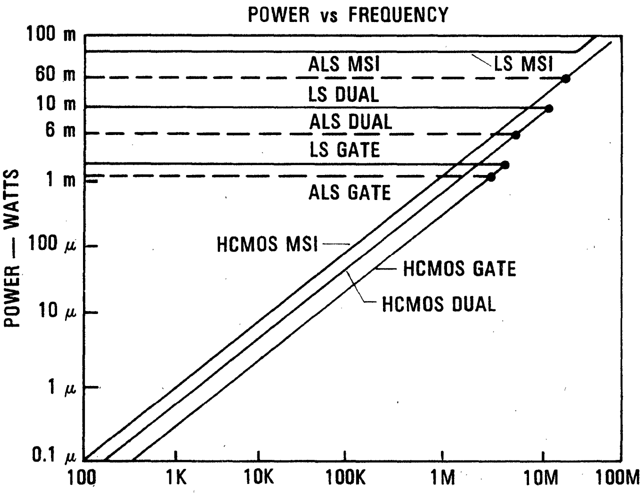

Figure 1

For gates and duals, HCMOS devices offer lower power consumption than LS devices up to approximately 3 and 9 MHz respectively and up to approximately 2.5 and 5 MHz for ALS devices. For MSI devices, fmax as opposed to power consumption becomes the limiting factor.

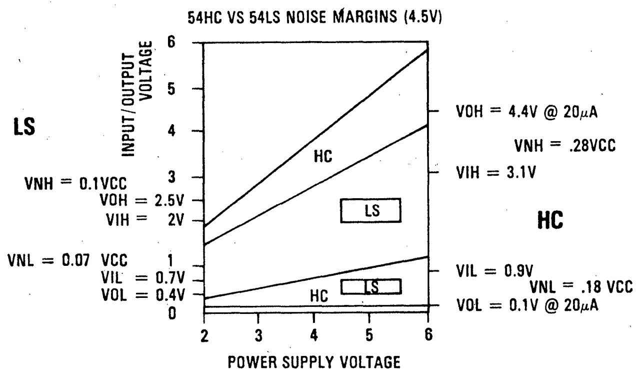

Figure 2

The noise immunity of Low Power Schottky devices is 10% (V_{NH}) and 7% (V_{NL}) of the minimum supply voltage (4.5V). HCMOS parts increase the noise margin to 28% and 18% respectively (at V_{CC} = 4.5V).

Superior Noise Immunity

Improved noise immunity is another advantage of HCMOS. Figure 2 shows that HCMOS provides greater noise immunity than LSTTL. The HCMOS noise immunity is 2.5 times that of Low Power Schottky TTL at 4.5 Volts. As a result, the HCMOS family is ideal for use in noisy environments.

High Speed CMOS

Power Supply Requirements

HCMOS also offers less stringent power supply requirements than LSTTL. As shown in Figure 3, HCMOS operates over the entire range of 2 Volts to 6 Volts, compared to 4.5 Volts to 5.5 Volts for Low Power Schottky. All DC and AC parameters are guaranteed over temperature extremes and are specified at 2.0, 4.5, and 6.0 Volts. As a result, power supply requirements are less demanding in terms of both output voltage and regulation. The AC and DC parameters are tested at worst case condition only (4.5 Volts for AC and 4.5/5.5V for DC). AC parameters are specified at 50 pF loads (150 pF for buffers).

Improved ESD Protection

TI's HCMOS family has been designed with superior protection against ESD. The ESD input protection circuitry, as illustrated in Figure 4, uses a combination of P+ and N+ diode clamps to the supply rails and a series N+ resistor for input gate protection. The outputs are protected by the P+ and N+ drain diodes of the output transistors and an additional P+ diode clamped to V_{CC} as illustrated in Figure 5. Protection typically exceeds 4000 Volts on inputs and 3000 Volts on outputs, and is guaranteed to 2000 Volts.

Improved Reliability

TI's HCMOS also offers an improvement in reliability not only through its superior ESD and latch-up protection, but also due to the low junction and operating temperatures inherent to HCMOS. Accelerated life tests show an improvement in the failure rate of TI's HCMOS over LSTTL, .00059% per 1,000 hours for HCMOS versus .0008% for LSTTL. For details, see the High-Speed CMOS Logic Quality and Reliability Brochure.

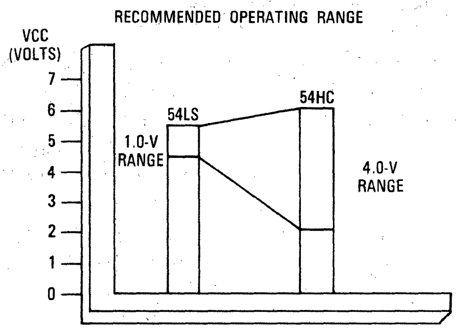
Design Considerations For HCMOS

The ESD protection structures on the inputs and outputs of all HCMOS devices must be considered under certain applications such as systems with multiple power supplies, and systems with partial power down.

In systems with multiple power supplies, if the power supplies ($V_{CC}1$ and $V_{CC}2$, Figure 6) differ by more than a Vbe (0.7 V), the ESD protection diodes will become forward biased. In addition, in systems where one device attempts to drive another device which is powered down, inputs/outputs can be protected by placing a diode between the device with an active power supply and the inactive device as shown in Figure 7. In the case of an unpowered driver or transceiver with an active bus, to prevent biasing of the ESD protection circuitry, a diode and capacitor may be used to isolate the package connected to the bus as detailed in Figure 8.

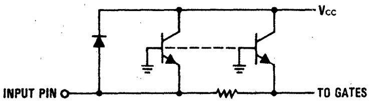
During the transition from one logic state to the other, there is an interval when both the PMOS and NMOS transistors are on causing a current spike on the V_{CC} and Ground leads. This spike may have a di/dt as high as 5000A/s causing voltage transients on V_{CC} and Ground. It is recommended by TI that a decoupling capacitor be placed across the V_{CC} and Ground leads within at least 2.5 inches from each package to reduce the effects of the spikes. Figure 9 is a graph of V_{CC} transients versus decoupling capacitor distance from the package. Figure 10 shows a test circuit for decoupling effects.

Figure 3



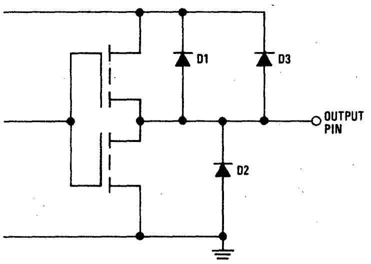
Power-supply requirements are far less stringent for HCMOS devices, making them ideal for use under a wide range of operating conditions.

Figure 4



Typically immune to 4000 Volts, TI's unique input protection circuitry provides excellent ESD protection.

Figure 5



TI's output protection circuitry provides ESD protection typically to 3000 Volts.

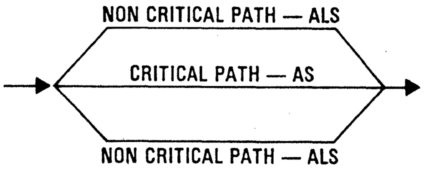
Advanced Low Power Schottky/Advanced Schottky

Texas Instruments' Advanced Low Power Schottky (ALS) and Advanced Schottky (AS) families provide a broad range of functions to aid in optimizing designs. The ALS and AS families enable a socket-by-socket selection of devices for the optimum combination of speed and power. This "Performance Budgeting" allows the designer to achieve outstanding performance levels.

In a typical system, not all logic devices operate at maximum frequencies. As a general rule, 70% of a system runs at frequencies less than the maximum clock frequency. This is called the non-critical path. The remaining 30% of the system is the high-speed portion, running at near maximum clock frequencies, and is considered the critical path. When operating under the 70/30 rule, the designer is able to optimize system performance by selection of the appropriate logic family.

For example, ALS/AS can be used to optimize a system by using ALS devices in the non-critical path and AS devices in the critical path. The ALS devices provide reasonable speed and minimum power dissipation, 1.2 mW/gate, while the AS devices offer minimal delay times, 1.7 ns, at a cost of 8 mW/gate. Of course, the power dissipation is still well below that of Schottky. By applying performance budgeting, designers are able to optimize the speed and power performance of digital systems.

LOGIC PERFORMANCE BUDGETING



TYPICAL SYSTEM MIX:	
70%	ALS
30%	AS

1000 GATE SYSTEM		
ALS	AS	FAST
700 GATES X 1.2MW/GATE 840MW	300 GATES X 8MW/GATE 2400MW	1000 Gates X 4MW/GATE
TOTAL 3240MW		TOTAL 4000MW
POWER SAVING 760MW — 19 PERCENT		

Other Advantages Of ALS/AS

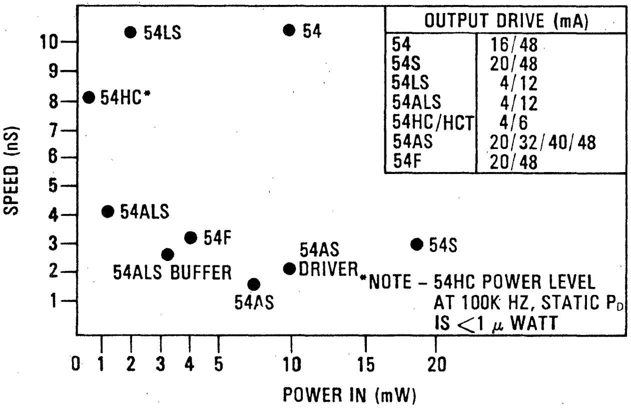
Designed as enhancements to the Low Power Schottky and Schottky families, ALS and AS offer a 4 X improvement in the speed/power product over the older technologies. ALS offers a 50% speed improvement over LSTTL and consumes only 60% the power of LS. Likewise, AS is a 40% speed improvement over Schottky and consumes only 40% the power of Schottky.

Both the ALS and AS families feature ESD protection approaching 4000 Volts by incorporating an NPN Schottky transistor on the input stage. This protection is twice as great as that of the LS/S family.

In addition, ALS and AS feature improved threshold voltage and reduced input leakage over LS and S TTL, respectively. ALS also offers improved noise immunity when compared to Low Power Schottky.

Other new features include special AC and DC "Miller-killer" circuits on most AS and selected ALS functions. The AC "Miller-killer" circuits reduce output current spiking, characteristic of TTL. DC "Milier-killer" circuits reduce the output capacitance on three-state devices.

MILITARY HIGH VOLUME PRODUCTS
TYPICAL BIPOLAR SPEED/POWER



OUTPUT DRIVE (mA)	
54	16/48
54S	20/48
54LS	4/12
54ALS	4/12
54HC/HCT	4/6
54AS	20/32/40/48
54F	20/48

A graphic representation of military IC speed/power characteristics shows the substantial improvements provided by 54ALS, 54AS, 54HC and 54F over their older counterparts (54LS and 54S). The new families are faster and consume far less power than the older versions. Note the important output drive specifications in the box.

Linear

Linear Nomenclature

Orders for linear functions as described in Selection Guide should include complete Device Type Number as noted:
EXAMPLE: LinCMOS Dual, Low Bias Operational Amplifier. Device Type Number — TLC27L2BMJGB.

TLC 27 L 2 B M JG B

PREFIX
Must contain two or three letters
TL = TI Linear Products
TLC = TI LinCMOS Products

CIRCUIT DESIGNATION
Must contain two or three numbers

BIAS CURRENT
L = Low, M = Med
No Letter = High

DEVICE COMPLEXITY
1 = Single
2 = Dual
4 = Quad

Class B Processing

PACKAGE
FK = LCCC
J = 14 Pin C-DIP
JG = 8 Pin C-DIP

OPERATING TEMPERATURE RANGE
M = Military (−55°C to 125°C)

INPUT OFFSET VOLTAGE
A = 5.0 mV, B = 2.0 mV
No Letter = 10.0 mV

STANDARD SECOND SOURCE PREFIXES

ADC = National
LM = National
MC = Motorola
OP = PMI
RM = Raytheon
SE = Signetics
SG = Silicon General
μA = Fairchild

Interface functions as described in Selection Guide should include complete Device Type Number as noted:
EXAMPLE: Dual Line Driver with Class B Processing. Device Type Number — SNJ55109AJ

SNJ 55 109A J

PREFIX
SN = TI Interface Product
SNJ = TI Interface Product
with Class B Processing

MIL TEMP RANGE
(−55°C to 125°C)

STANDARD SECOND SOURCE PREFIXES
AM = AMD
DS = National
μA = Fairchild

PACKAGE
FK = Chip Carrier
J = 14/16/20 Pin C-DIP
JG = 8 Pin C-DIP
W = Flat Pack

CIRCUIT DESIGNATION
May contain two, three or four numbers & letters

Linear Selection Guide

Operational Amplifiers, Single, Internally Compensated

Military Temperature Range (Values Specified For $T_A = 25°C$)

Device Number	Supply Voltage (V) Min	Supply Voltage (V) Max	V_{IO} (mV) Max	I_{IB} (nA) Max	S.R. (V/μS) Typ	B.W. (MHz) Typ	Description

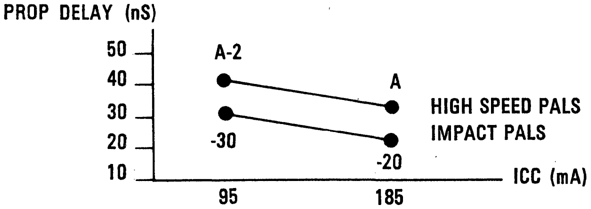
Bipolar Impact Technology

Fastest PALS

20 Pin PAL

IMPACT™ (IMPlanted Advanced Composed Technology) is an advanced bipolar technology. IMPACT's 2 μM feature size and 1.05 mil^2 transistor area offers performance advantages in speed, power, and circuit density over preceding bipolar technologies, the IMPACT technology is in production today and is being applied PAL product families, Biploar PROMs, and selected MSI/LSI ALS and AS devices.



PAL Characteristics Comparison (Military)

	TI				MMI	
Parameter	16XXA	16XXA-2	16XX-20	16XX-30	16XXA	16XXA-2

MOS Memory

MOS Memory Nomenclature

EXAMPLE: SMJ 4164 −15 JD S

PREFIX
Must contain three letters
SMJ = Class B Processing, JEDEC Publication 101

CIRCUIT DESIGNATOR
Must contain four characters

ACCESS TIME
Device types are available with various speeds

TEMPERATURE RANGE
Must contain one letter only
M = −55°C to 125°C
S = −55°C to 100°C (except 4164 & 4256 which are −55°C to 110°C)
E = 40°C to 85°C
L = 0°C to 70°C

PACKAGE TYPE
Must contain one or two letters

Dynamic RAMs

Texas Instrument's Military Dynamic RAM family provides the memory system designer the highest density random access memories at the lowest cost per bit. This is best illustrated in Figure 1, a chart showing the relative cost factor differential between today's available SRAM and DRAM technologies normalized to the 256K density. In general, the cost ratio of an SRAM vs DRAM (density normalized) is about 8:1, or in other words a DRAM bit costs ⅛ as much as an SRAM bit. In the same token, SRAM densities lag DRAM densities by a factor of 4 at any given time.

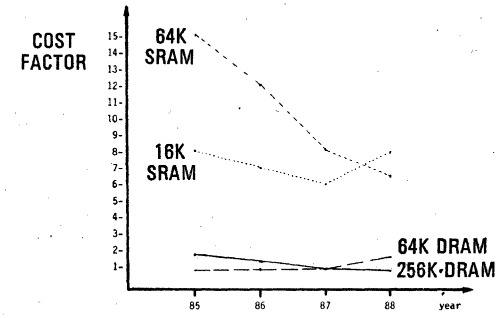

Figure 1: Cost per bit of Random Access Memories over time (Normalized to 256K Density)

DRAM Product Spectrum

The TI Military DRAM family includes a wide range of density configurations, performance and package options, as well as temperature and HI-REL processing options. Figure 2 shows the 5 generic DRAM part types available from TI that includes 64K and 256K densities in both X1 and X4 output configurations as well as a multiport 64K DRAM. Upward pin-for-pin compatibility is maintained from the 64K to 256K DRAM allowing the memory designer to capitalize on his previous TI 64K DRAM investment by expanding the system memory density by 4-fold without any additional cost in board real estate. This equally applies to the X4 output configured part, the SMJ4416 and SMJ4464.

The remaining member of the TI Military DRAM family is the SMJ4161 Multiport Video RAM. The 4161 supports dual-access-ability—random access port behaves exactly like the SMJ4164 64K X 1 DRAM and the sequential access port includes 4 cascaded 64-bit shift registers that can be configured for video data rates in excess of 150 MHz. The SMJ4161 features full asynchronous dual access capability except when transferring data between the 256-bit shift register and the 65,536-bit memory array. The SMJ4161 is especially useful in high resolution graphics system, radar/sonar, test equipment, image processing and communication systems.

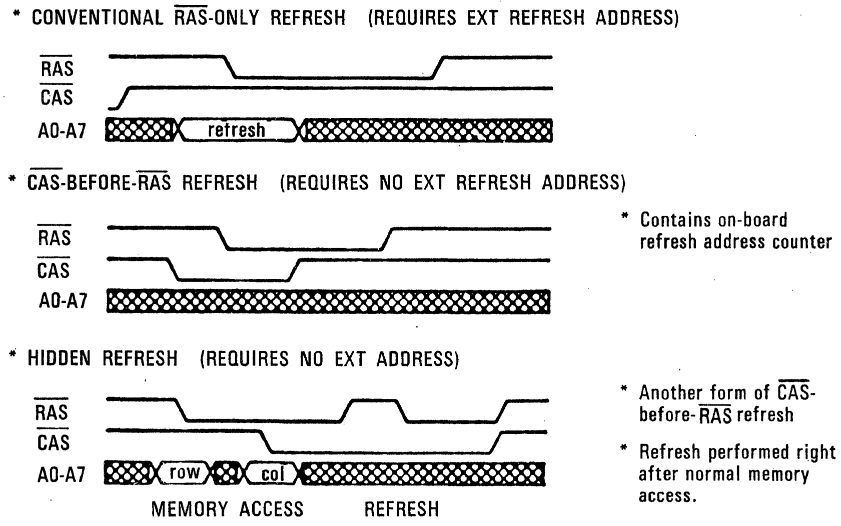
Figure 2: TI Military DRAM family

TI 256K DRAM Refresh Options

The TI 256K DRAMs employ the same refresh cycle period as their predecessors the 64K DRAMs. This refresh cycle period is satisfied by strobing each of the 256 rows every 4MS, resulting in a very low refresh overhead of only 1.3% of the total period. In addition to the RAS-only refresh mode that had become the convention on 64K DRAMs, the TI 256K DRAMs offer the user two more optional refresh modes -1) CAS-before-RAS and 2) hidden refresh. Figure 3 shows the basic operation of all 3 refresh modes. In the conventional RAS-only refresh, each refresh cycle required an external address, generated by either a DRAM controller or refresh counter circuitry. However in the RAS-before-CAS or hidden refresh, this refresh counter has been incorporated on-board the 256K DRAM, thus eliminating the need for an external counter as the address lines are treated as don't care during refresh cycles. CAS-before-RAS refresh is accomplished by bringing CAS low before pulling RAS low (i.e. . . . opposite convention of memory cycle), and hidden refresh is another form of CAS-before-RAS in that CAS is kept low after normal memory cycle and RAS is strobed. The user benefits derived from these new refresh options are lower system chip count and reduced refresh overhead possibly resulting in "transparent" refresh.



* CONVENTIONAL RAS-ONLY REFRESH (REQUIRES EXT REFRESH ADDRESS)

* CAS-BEFORE-RAS REFRESH (REQUIRES NO EXT REFRESH ADDRESS)

* Contains on-board refresh address counter

* HIDDEN REFRESH (REQUIRES NO EXT ADDRESS)

* Another form of CAS-before-RAS refresh

* Refresh performed right after normal memory access.

Digital Signal Processor

The Texas Instruments family of Digital Signal Processors (DSP's) have been designed to support a wide range of high speed and numeric intensive applications. The SMJ320 single-chip microcomputer family combines the flexibility of a high speed controller with the numerical capability of an array processor, thereby offering an inexpensive alternative to multi-chip bit-slice processors (see Figure 1). The SMJ320 DSP circuits offer significant advantages as compared to similar bit slice implementations, namely reduced power dissipation, 10X reduction in chip count, and greater ease of use. In addition, development support is available from TI for all phases of 320 application development, that includes low cost software and hardware development tools (i.e. . . . evaluation module, emulator's, simulators, assembler's, linkers, analog I/F boards, digital filter design software, etc. . . .) that are supported on several host computers (DEC, IBM, TI, etc. . . .) and operating systems (VMS, UNIX, MVS, CMS, MS/PC DOS, etc. . . .).

The SMJ320 DSP Circuits are finding their way into military applications such as missile guidance, smart munitions, control (servo, position and rate, reference), communications and signal processing (digital filtering, data encryption/scrambling, FFT's, voice processing), radar/sonor, ECM, EC2M, and many others.

SMJ32010 Product Features Include:

• 5 Million Instructions per Second Max Execution Rate • 32-Bit Accumulator/ALU • Highly-Pipelined Modified Harvard Architecture • Separate Data and Program Buses • Mostly Single Cycle Executable Instruction Set • On-Board Parallel 16 x 16 Multiplier • On-Board Parallel Barrel and Normalization Shifters • 144 x 1 On-Chip Data RAM • 4K x 16 External Direct Addressing Range • Interrupt Interfaces • 950 MW Typical Power Dissipation • DESC Approved #8405301QC, ZC • 40 Pin Ceramic DIP and 44 Pad Leadless Ceramic Chip Carrier • MIL-STD-883C Class B Hi-Reliability Processing • Demonstrated Radiation Hardness Suitable for Most Tactical Military Applications • Comprehensive Set of Low-Cost and Sophisticated Software and Hardware Development Tools Available • CMOS Version Planned in Future.

SMJ32020* Product Features Include:

• 2-3X Higher Throughput Than SMJ32010 When Operating on DSP Algorithms • 32-Bit Accumulator/ALU • Highly Pipelined Modified Harvard Architecture • Separate Data and Program Buses • Mostly Single Sycle Executable Instruction Set • Single Cycle Multiply/Accumulate Instructions • On-Board Parallel Barrel, Normalization Shifters • 5 Auxiliary Registers With Dedicated ALU for Auto Increment/Decrement Capability • 544 x 16 On-Chip Memory • 256 x 16 Configurable as either Data RAM or Program Memory Storage • 128K x 16 External Direct Addressing Range • 64K x 16 Program Memory, 64K x 16 Data Memory • 16 Input and 16 Output Channels • Multiprocessing Capabilities • On-Chip Hardware to Support Global Memory Access • Hold and Holda Signals for DMA Support • Synchronization Input for Synchronous Multiprocessor Configurations • Memory Ready/Wait Facilities • Comprehensive Instruction Set • Super-Set of 32010 Instruction Set • Upward Software Compatibility Maintained • Instruction Set Support for Floating Point Operations • Fractional and Integer Arithmetic • Bit Manipulation and Logical Instructions • Block Moves for Data/Program Management (Max 80M Bits/Sec) • Repeat Instruction for Efficient Use of Program Space • Direct, Indirect, Immediate Addressing Modes • On-Chip 16-Bit Timer for Control Operations • Dedicated Serial I/O Ports • Single 5V Supply 2.4 Micron NMOS Technology • 1.2W Typical Power Dissipation • 68-Pad Leadless Ceramic Chip Carrier Package Option Planned • CMOS Version Planned in Future.

* Future Planned Product.

Bipolar Microprocessor

SBP9989 Bipolar Microprocessor Family

The SBP9989 family features a sophisticated memory-to-memory architecture and Bipolar I2L technology that builds-in environmental toughness at the design stage. Unsurpassed in its ability to perform in interrupt intensive applications such as multiple target tracking and decision making systems, the SBP9989 16-bit microprocessor is well suited to meet the demanding real time processing needs of microprocessor embedded computer systems. In addition, dedicated signal lines aid in the implementing of attached processor systems with an efficient and reliable protocol that guards against bus contentions. The SBP9989 as well is supported by wide range of universal and custom peripheral circuit functions that can dramatically reduce overall system chip count while providing basic parallel processor system functions and data transfer control. Hardware and Software development support is available in the form of the 9989 XDS/22 Host independent emulator with cross S/W support for IBM, DEC VAX, TI990 and TIPC and IBM PC.

Product Features:

- 4.4 MHz Clock
- Comprehensive Instruction Set
- 16 H/W & 16 S/W Interrupt Levels
- 128K Bytes Addressing Range
- Multiprocessor Signals
- Serial I/O Capability
- Radiation Tolerant Technology
- SBR9000

LIMITED WARRANTY

Devices sold by Xicor, Inc. are covered by the warranty and patent indemnification provisions appearing in its Terms of Sale only. Xicor, Inc. makes no warranty, express, statutory, implied, or by description regarding the information set forth herein or regarding the freedom of the described devices from patent infringement. Xicor, Inc. makes no warranty of merchantability or fitness for any purpose. Xicor, Inc. reserves the right to discontinue production and change specifications and prices at any time and without notice.

Xicor, Inc. assumes no responsibility for the use of any circuitry other than circuitry embodied in a Xicor, Inc. product. No other circuits, patents, licenses are implied.

LIFE RELATED POLICY

In situations where semiconductor component failure may endanger life, system designers using this product should design the system with appropriate error detection and correction, redundancy and back-up features to prevent such an occurrence.

Xicor's products are not authorized for use as critical components in life support devices or systems.

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

WHAT'S NEW IN IC Updates

IF YOU NEED THE IC MASTER YOU NEED IC MASTER UPDATES

Updates your IC Master
THREE (3) TIMES a year
SPRING, SUMMER
and FALL

If you're not getting them,
call us today:
WEST 408/249-6800
EAST 516/227-1300

IS THIS A BORROWED COPY?

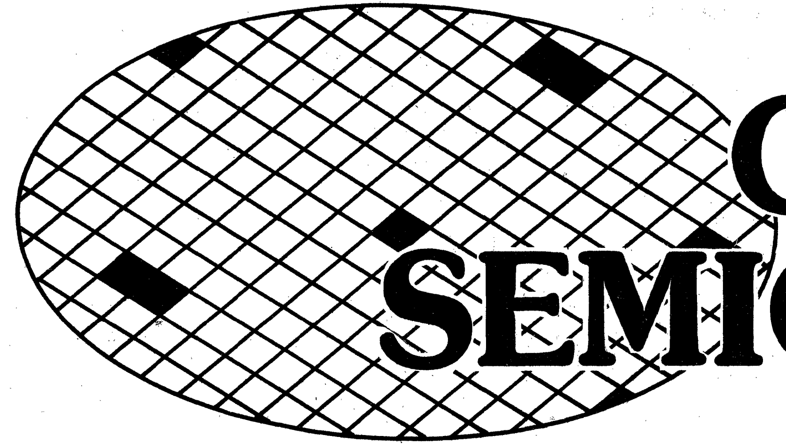
Avoid the hassle and order your own personal two-volume set of IC MASTER. It's the surest way to simplify your IC selection efforts.

Only IC MASTER allows you to examine and compare the specifications, relative strengths, and weaknesses of all devices in serious contention for your application. And only IC MASTER brings you actual manufacturers' data sheets, allowing you to make complete and definitive device selections.

You can order IC MASTER simply by charging it to your VISA or Master Card credit card. To place your order (USA only) call now: (408) 249-6800/(516) 227-1300. To order outside the USA, see list of authorized IC MASTER distributors on page 1471 of Vol. I.

WHAT'S NEW IN IC MASTER

DON'T MISS THE EXPANDED CUSTOM/ SEMICUSTOM IC SECTION

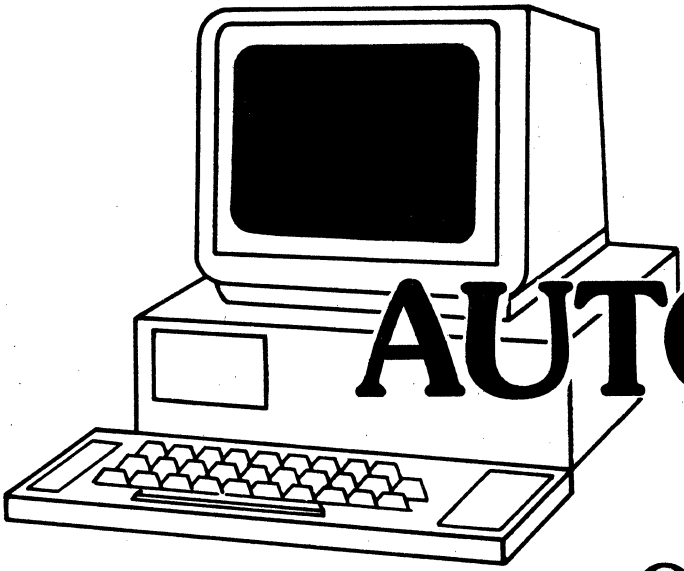


Lists software design tools available for Programmable Logic Devices, Gate Arrays, Standard Cells, and Linear and Linear/ Digital Arrays. Major macros in VLSI/LSI Macrocell Libraries are listed by source.

Volume II, page 4401

WHAT'S NEW IN IC MASTER

DON'T MISS THE NEW DESIGN AUTOMATION IC SECTION

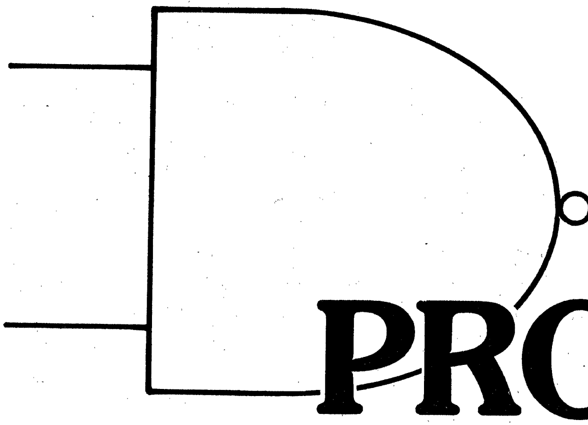


Quick and easy way to determine relationships between workstations, computers, software, semicustom manufacturers and CAE/CAD providers.

Volume II, page 4901

WHAT'S NEW IN IC MASTER

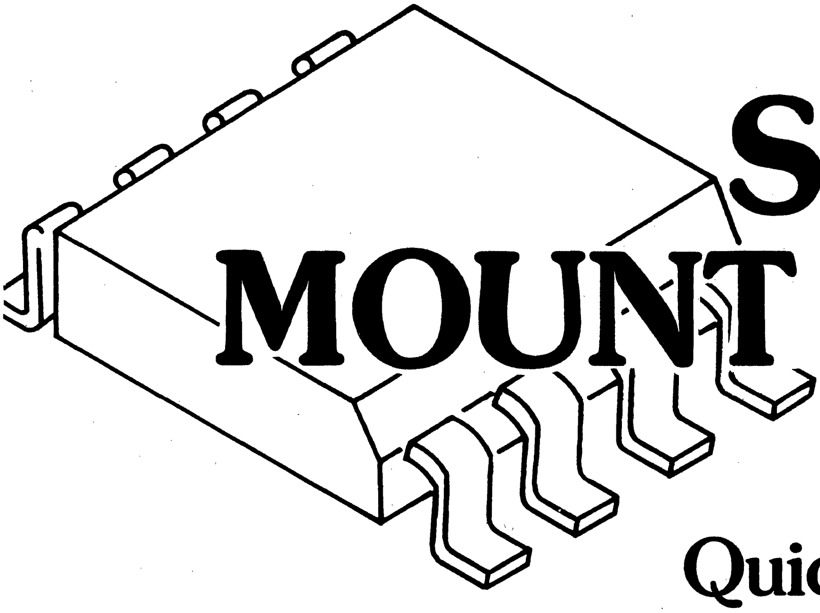
DON'T MISS THE NEW DIGITAL SIGNAL PROCESSING IC SECTION



Easy to find DSP devices.

Volume I, Page 801

WHAT'S NEW IN IC MASTER



DON'T MISS THE NEW SURFACE MOUNT DEVICE IC SECTION

Quickly shows you by base number and package, what surface mount devices are available and from which manufacturers.

Volume II, Page 5201

NEED MORE PRODUCT DETAILS

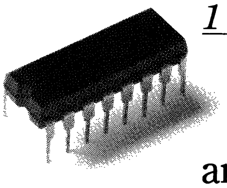
Use the IC MASTER's NEW Telemarketing response system to request additional product information from IC manufacturers and CAE/CAD providers. CALL **800 443-0100 (EXT.) 518**

48 hour turn-around on your request . . . 24 hours a day, 7 days a week service.

TOSHIBA.
THE POWER IN MOS ICs.

For years Toshiba has been the power in MOS ICs. Leaders in static RAMs, 256K DRAMs and ROMs. The world's second largest producer of CMOS logic and 4-bit MPUs. A volume producer of gate arrays and custom products. And now, as the world moves from NMOS to CMOS, guess who has the experience, the technology and the production capacity to lead the way? The people with the power, the #1 CMOS manufacturer in the world. Toshiba.

TOSHIBA IS MEMORY POWER



1 Mb Dynamic RAMs

We're a leader in volume production of 1 Mb DRAMs and also 256K DRAMs. If you are thinking powerful memory, talk with us.

Static RAMs in NMOS and CMOS

We make a really fast 2K x 8 static RAM — 35 ns. And we were first to introduce the 8K x 8 CMOS static RAM. Today we lead the industry in byte wide memory products with the 32K x 8 (256K) CMOS static RAM now available!

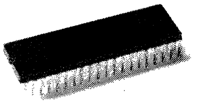
ROMs in NMOS and CMOS

We developed the 256K ROM, and within a year of its introduction, we were supplying over 50% of worldwide demand. In CMOS we created and are now producing in volume the 1Mb high-speed CMOS mask ROM.

EPROMs in NMOS and CMOS

Toshiba was first in the world to introduce the 256K CMOS EPROM. And we can meet all your EPROM needs today with high density products that can accommodate an entire utility program.

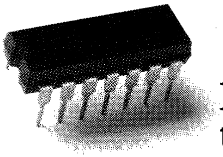
TOSHIBA IS MPU POWER



Toshiba offers a CMOS Z-80® MPU and peripherals that are hardware and software compatible with the Z-80 family, and they are second sourced.

In addition, we have high volume production now on CMOS and NMOS 8048 and 8049 products. We're also in volume production with the 8085 and peripherals. In fact, Toshiba has one of the world's most comprehensive lines of CMOS and NMOS MPUs.

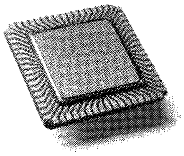
TOSHIBA IS LOGIC POWER



In 1980 Toshiba introduced the first high-speed CMOS logic series in the industry. Today we are #2 worldwide in the production of CMOS logic.

Our new 74HC series has an operating speed 30 times greater than standard CMOS logic, with low power requirements, wide voltage ranges and high noise immunity.

TOSHIBA IS PRODUCTION POWER FOR STANDARD CELLS, GATE ARRAYS & CUSTOM PRODUCTS.



Toshiba has ample design capability at its design centers, so with our experience, LDS™ software and applications staff, you can develop your own.

More importantly, we have the volume production capability to meet your needs.

Toshiba. The power in design, development and production. In memories, MPUs, logic, custom and semicustom. If you're working in MOS, meet the people with the power. Meet Toshiba.

IRREFUTABLE LOGIC.

You've probably heard a lot lately about advanced bipolar logic technologies. Some of them claiming to be an even more logical choice than FAST.™ So we'd like to set the record straight.

The fact is, FAST's 3ns speed, 4mW power, and spec consistency put it in a class by itself. That's why it's the irrefutable choice of design engineers in commercial and military industries the world over. And it's supported by two major semiconductor manufacturers as second sources.

The constantly growing FAST family offers a broad product line of the most popular, useful functions: well over 100 SSI, MSI, and LSI devices. We also provide thorough technical support–with a FAST data book, applications handbook, dedicated sales force, and access to our high-technology Fairtech Centers. Not to mention off-the-shelf delivery, from each and every Fairchild sales office or authorized distributor.

We offer all the processing options you need. Such as additional burn-in and special marking. Packaging in DIPs, flatpaks, and SOICs, with PLCCs on the way. And we stock one of the widest varieties of JAN-qualified parts.

So the next time you're trying to decide between advanced logic technologies, reach for the red book on your shelf and check our specs. Or call The Fairchild Information Center, 1-800-554-4443, for more information.

We're convinced you'll choose FAST.

It's logic of a higher order.

We're taking the high ground.

INTRODUCTION TO DIGITAL

The Master Selection Guide provides information for making initial product selections. Digital devices are listed by major product families: CMOS, ECL, GaAs, or TTL, and within them by functional groups: arithmetic, buffers, inverters, etc. The adjacent table shows how these families and functional groups are organized. Other digital circuits not in the major logic families are listed under the general heading Digital-Special.

A separate guide for circuits specifically directed to Digital Signal Processing (DSP) applications is included within the Digital section; the table below shows how this information is organized. Some of these circuits may also be repeated in the Digital families, the Interface, or Microprocessor portions of IC Master.

The Master Selection Guide charts assist you in finding specific ICs to fill your requirements. This selection information is complemented by specific device data sheets provided by the various IC manufacturers. These data sheets are located following the digital product selection guides and are referenced by page number beside the individual part entries.

Note: A few digital devices, such as watch, clock, speech and music circuits, are not covered in the digital section, but covered in detail in the Linear-Consumer guide. For further assistance on locating functions, topics or key words, consult the MSG Function Index at the beginning of this volume.

The manufacturers listed above have provided detailed information on their latest and most significant products.

EINFÜHRUNG DIGITAL-SCHALTUNGEN

Der Master Selection Guide für Digitalschaltungen enthält alle Informationen, die Sie für die Erstauswahl Ihres Produkts benötigen. Die Bauteile, die in diesem Abschnitt erscheinen, sowohl im Selection Guide als auch auf den Datenblättern, sind in allen Master Indexes enthalten.

Die ersten beiden Seiten des Digital-Teils beinhalten Leistungs-vergleiche der wichtigsten Digitalfamilien. Daran anschließend finden Sie ein Verzeichnis der Bauteile jeder Familie nach Funktionen (arithmetische Funktionen, Buffers/Inverters usw.). Diesen Listen folgen die Datenblätter der Hersteller. Der Master Selection Guide verweist jeweils auf das entsprechende Datenblatt.

Einige Digital-Schaltungen (Rechner, Uhren-Chips und elektronische Orgel-Schaltungen), die in diesem Teil nicht enthalten sind, werden ausführlich im Abschnitt Linear-Consumer behandelt. Digital-Schaltungen, die nicht in einer der größeren Logik-Familien enthalten sind, finden sich unter der Rubrik "Digital-Sonstige Bauteile" (Digital — Other Devices).

Dieser Abschnitt wird nicht durch Hinweise auf Gehäuseformen Kompliziert. Die entsprechenden Suffix wurden meistens weggelassen. Weitere Information über die Suffixe jedes Herstellers erhalten Sie über das Numerische Typenverzeichnis. Im ganzen Master Selection Guide sind alle Bauteile mit militärischem Temperaturebereich (—55° bis 125°C) durch ein Kreuz (†) vor dem Namen des Herstellers gekennzeichnet. Die Namen der Hersteller sind normalerweise ausgerschrieben; einige jedoch sind abgekurst. Die Abkürzungen werden auf S. 902 erklärt.

INTRODUCTION AU SYSTEME DIGITAL

Le Guide Général de Sélection fournit suffisamment de renseignements pour permettre des selections initiales de produits. Tous les appareils énumérés dans cette Section, à la fois dans le Premier Guide de Sélection et le feuilles de données, apparaissent également dans tous les autres index.

Les deux premières pages de la Section "Digital" présentent des comparaisons de performance entre les principales familles de système digital. Suivent ensuite des listes d'appareils de chaque famille, classés par groupes fonctionnels (arithmétique, registres, invertisseurs, etc.). Les listes de première sélection sont suivies par des feuilles de données par appareil, fournies par les fabricants. Les références de numéros de pages de ces données sont communiquées dans les listes de première sélection.

Quelques circuits digitaux — calculatrices, circuits de montre, et circuits électroniques primaires — no signalés dans cette Section, sont étudiés en detail dans la Section "Linéaire". Les circuits digitaux non inclus dans l'une des familles princiaples de Legique, sont énumérés dans la rubrique "Autres Systemes Digitaux" (Digital-Other Devices).

Cette Section ne fait pas apparaître les types de boitier. Les suffixes indiquant les types de boitier sont généralement omis. Pour obtenir des renseignements supplémentaires sur les suffixes utilsés par chaque société, veuillez vous reporter au Guide des Numéros de Pièces. Dans tout le Guide Général de Sélection chaque appareil possédant la variante complète de température imposée par l'Armée (—55°C à 125°C) est indiqué par le symbole (†) inscrit devant le nom du fabricant. Les noms des fabricants sont généralement écrits en entier, il arrive cependant que certains soient abrégés. Voir page 902 pour obtenir la signification de ces abréviations.

INTRODUCCIÓN A DIGITAL

La Guía Maestra de Selección provee suficiente información para hacer selecciones iniciales de producto. Todas las componentes que aparecen en esta sección, ya sea en la guía de selección inicial o en las páginas de datos, están incluidas en todos los otros índices.

Las primeras dos páginas de la sección digital presenta comparación de funcionamiento entre las familias digitales mayores. Estas están sequidas por listas de las componentes correspondiente a cada familia y organizadas en grupos funcionales (aritmético, separadores, invertidores, etc). Las listas de selección inicial están sequidas por las páginas de datos, de las componentes proveídas por los fabricantes. Referencias del número de la página a estas páginas de datos están dadas con las listas de selección incial.

Algunos circuitos digitales — calculadoras, circuitos integrados de relojes, y circuitos de órganos eléctricos — no incluídas en esta sección son detalladas en la sección de Consumidor-Lineal. Los circuitos digitales no incluídos entre las familias lógicas mayores aparecen bajo el título Digital-Otras Componentes.

Esta sección no es complicada por referencias al estilo constructivo; los sufijos que denotan estilo constructivo han sido generalmente omitidos. Para información adicional sobre sufijos de las compañías, refiérase a la Guía de Número de Pieza. A lo largo de la Guía de Selección Maestra, cada intérvalo completo de temperatura para uso militar (—55° a 125°C) de la componente aparece indicada por el signo fabricantes no son generalmente deletreados; sin embargo, algunos aparecen abreviados y las abreviaturas son explicadas en la página 902.

ディジタルへの案内

マスターセレクションガイドは最初の製品選択には充分の資料を揃えています。本セレクション中のセレクションガイドとデータののっているページに記載されている全製品は他の全てのインデックスにも入っています。

ディジタルセレクションの最初の２ページには主要なディジタルファミリーの性能比較がのっています。次のページからはそのファミリーが機能グループ毎に分類されています（例えばアリスメティック，バッファ／インバータ…と云うように）。その次にのせてあるのは各メーカーのデータシートです。このデータシートを見つけるにはセレクションガイドにのっているページをめくって下さい。

カルキュレーター用，時計用チップ，電子オルガン用回路はこのセクションでなく，リニアーコンシューマーセクションに詳細に紹介されています。

このセクションではパッケージにはふれていません。パッケージ形状のサフィックスについての情報は“パーツナンバーガイド”を参照して下さい。
マスターセレクションガイドの全ページ，ミリタリー温度範囲（－５５℃～－１２５℃）の製品は剣じるし（　）をメーカー名の前につけてあります。メーカー名は通常簡略化はしていません。簡略化されているものについては1902ページにその説明があります。

Sequencer, Programmable FFT Address Sequencer	AM29540	AMD

Note: This section lists devices specifically directed to high-speed, real-time processing. In many cases these devices, performance variations, and slower counterparts are listed by function in other sections. Such related listings can be located by reviewing functional categories in the Master Selection Guide Index or by checking part numbers in the Part Number Index.

Hex Inverter/Gate (quad inverter, dual NAND)	333A/C	TeledyneS	
	333B/M	† TeledyneS	
Latches			
Quad	MC682	Motorola	
Multiplexers (Digital)			
Dual 4-Bit	351A/C	TeledyneS	
8-Bit	350A/C	TeledyneS	95
Multivibrators			
Dual Monostable	MC667	Motorola	
	342A/C	TeledyneS	
	342B/M	† TeledyneS	
Dual Retriggerable Monostable	347A/C	TeledyneS	
	347B/M	† TeledyneS	100
Shift Registers			
4-Bit Parallel-In Parallel-Out	MC686	Motorola	
	375A/C	TeledyneS	
	375B/M	† TeledyneS	
Translators			
LSL-TTL Level Converter	FZH165B	Siemens	
Dual High to Low Interface (HNL to DTL, TTL)	361A/C	TeledyneS	105
	361B/M	† TeledyneS	
Dual Interface Element, (line driver, receiver, ECL to TTL, MOS to TTL, Schmitt trigger)	MC696	Motorola	
	396AC	TeledyneS	
Dual Low to High Interface (TTL to HNL)	362A/C	TeledyneS	
	362B/M	† TeledyneS	110

† Military Temperature Range (−55° to 125°C)

* Typical Value

Bold face indicates additional data is provided on the page noted.

DIGITAL-HNIL/HTL (Cont'd)

Function	Device	Source	Line
Translators (Cont'd)			
Triple High to Low (HTL to TTL)			
	MC665	Motorola	
Triple Low to High (TTL to HTL)			
	MC666	Motorola	
Quad Low to High Interface (TTL to HNL)			
	363A/C	TeledyneS	
	363B/M	† TeledyneS	
Hex Inverter/Interface (low to high: TTL, CMOS to HTL, CMOS)	MC691	Motorola	5
Miscellaneous			
Timer (see also linear-timers)			
	355A/C	TeledyneS	
Dual Pulse Stretcher			
	MC675	Motorola	
	349A/C	TeledyneS	
Quad Schmitt Trigger/Line Receiver			
	367A/C	TeledyneS	
	367B/M	† TeledyneS	10
Quad Schmitt Trigger/Line Receiver, Open Collector			
	368A/C	TeledyneS	

† Military Temperature Range (−55° to 125°C)

* Typical Value

Bold face indicates additional data is provided on the page noted.

SECTION	PRODUCTS IN SECTION
Digital	Arithmetic functions, buffers/inverters, counters, decoders, drivers, flip-flops, gates, latches, memories, multiplexers, multivibrators, oscillators/dividers, shift registers, translators.
Military	Military-commercial and commercial-military cross-references; QPL-38510/xx list; military ICs.
Microprocesser	Microprocessors, microcomputers, and microprocessor system components.
Microprocessor Development Systems	Systems covered range from simple, single-user, text-editing stations to multi-user computers dedicated to software development.
Microcomputer Support Boards	Boards with functions and peripheral controllers.
Interface	Analog switches, analog-to-digital converters, digital-to-analog converters, display converters, display drivers, error checking circuits, keyboard encoders-decoders, drivers, sense amplifiers, and transmitters/receivers.
Linear	Special-purpose amplifiers, arrays, comparators, consumer circuits, followers, operational amplifliers, phase locked loop circuits, telecommunication circuits, timers, voltage regulators, and special functions.
Memory	Character generators, code converters, FIFOs, LIFOS, E^2PROMs, PROMs, RAMs, ROMs and shift registers.
Custom/ Semicustom	Custom/Semicustom linear and digital gate arrays, standard cells, programmable logic arrays (PLAs), and all compatible design tools.
Design Automation	Design Automation interrelated tables showing relationships among workstations, computers, software, semicustom manufacturers and CAE/CAD providers.
SMD Packages	Surface Mount Directory from base device numbers to surface mount packages and suppliers.
Alternate Source Directory	Alternate Source Directory... Industry-wide alternate source cross reference pin-for-pin and functional equivalents to available ICs.

SIX KEY PHASES OF NEW SYSTEM DEVELOPMENT

Planning

A good design

is “mastered” early.

The best time for an engineer to pick the integrated circuits that will go into his next design is at an early stage in the design process when the engineer's plans are still flexible enough to take full advantage of the features selected.

There is a point in the early phases of every design when engineers focus on selecting integrated circuits. They examine specifications, weigh relative strengths and weaknesses of various devices, and choose the field of candidates. This critical time in the design cycle when designers want to be sure the right devices are in serious contention for their applications.

This is when the engineer reaches into his technical reference library. Of the material on his shelves, **IC MASTER** is the only reference source that has been especially prepared for this moment.

The engineer can look up each precise function that he needs and see all of the devices—and their manufacturers—that might satisfy his requirements. He sees this information for all manufacturers, not just for advertisers. But if an IC maker has chosen to include technical data for his products in **IC MASTER**, the engineer sees each index listing for that manufacturer in **bold face type** accompanied by the **page number** on which the data appears; the engineer can then turn immediately to the advertiser's technical data to see if the device fits his needs.

Next time, begin with the MASTER...where engineering design begins!

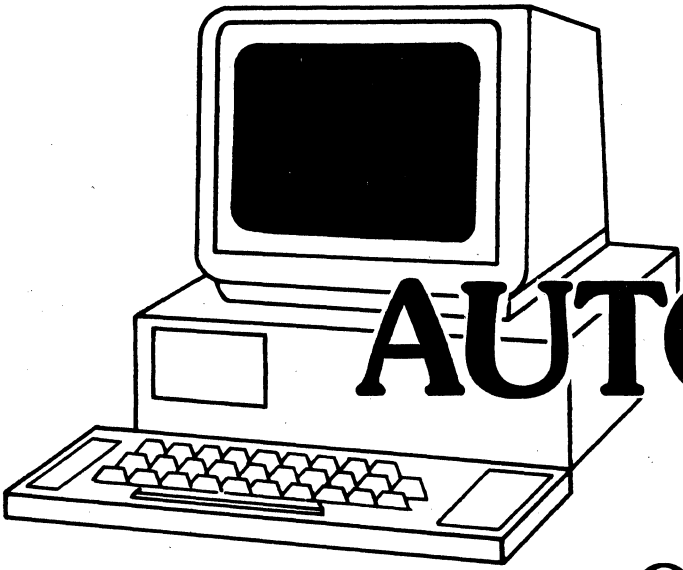
IC MASTER

WHAT'S NEW IN IC MASTER

DON'T MISS THE EXPANDED CUSTOM/ SEMICUSTOM IC SECTION

Lists software design tools available for Programmable Logic Devices, Gate Arrays, Standard Cells, and Linear and Linear/ Digital Arrays. Major macros in VLSI/LSI Macrocell Libraries are listed by source.

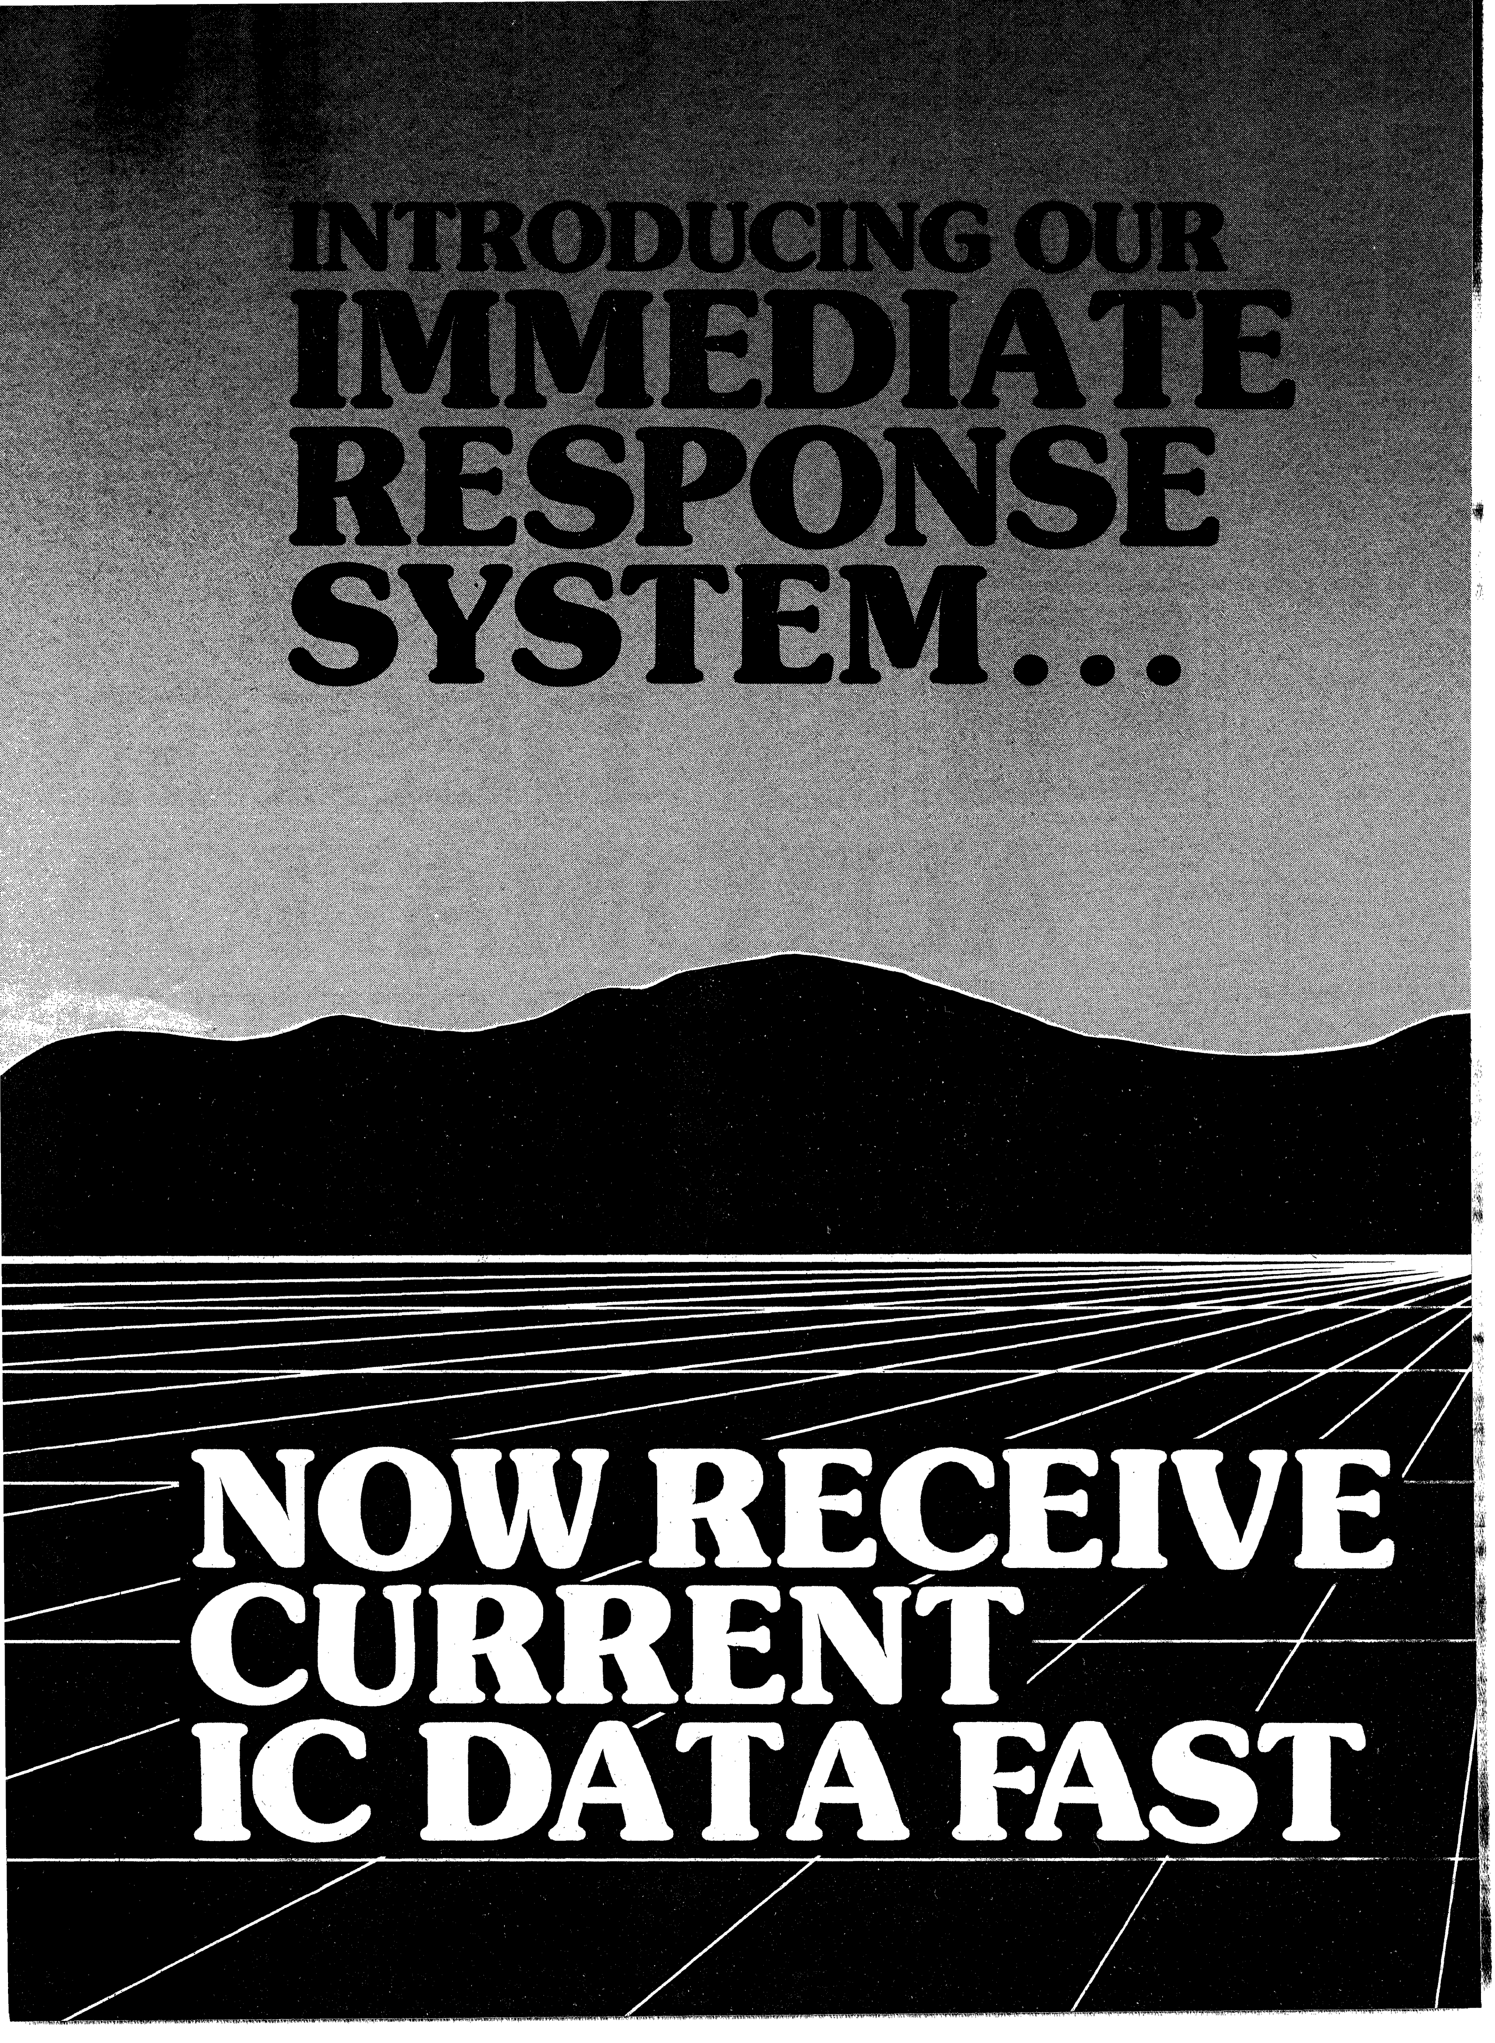
Volume II, page 4401



DON'T MISS THE NEW DESIGN AUTOMATION IC SECTION

Quick and easy way to determine relationships between workstations, computers, software, semicustom manufacturers and CAE/CAD providers.

Volume II, page 4901



INTRODUCING OUR
IMMEDIATE
RESPONSE
SYSTEM...
NOW RECEIVE
CURRENT
IC DATA FAST

Dear IC MASTER User:

ANNOUNCING: A new, innovative way to request and receive up-to-date IC product data.

The IC MASTER introduces an IMMEDIATE response system. Operational **24 hours a day, 7 days a week,** you can now phone in your requests for the most current IC product data available from IC manufacturers who have product data sheets in the IC MASTER, at no cost to you. Here's all you do:

Step 1 **Phone 800-443-0100** and ask for Extention #518

Step 2 When asked, simply tell the operator the name(s) of the manufacturer whose part you are interested in . . . the **specific** part number you want information on . . . if you want a data sheet and/or an application note . . . and if you want a salesperson to call.

Step 3 Provide you name, title, company, address, and phone number.

That's all you do! We do the rest. Your request will be in the hands of the company you inquired about within 24 hours.

We will follow up within a week to make sure your request was expedited and your needs were met.

It's important to us that we provide you with the best source of up-to-date IC product data available in the market . . . we've been doing it for over ten years, and we aren't stopping now.

We hope this **added new** service will contribute to a further reduction in your IC selection time.

call 800-443-0100 518 (ext.)

WHAT'S NEW IN IC MASTER

DON'T MISS THE NEW DIGITAL SIGNAL PROCESSING IC SECTION

Easy to find DSP
devices.

Volume I, Page 801

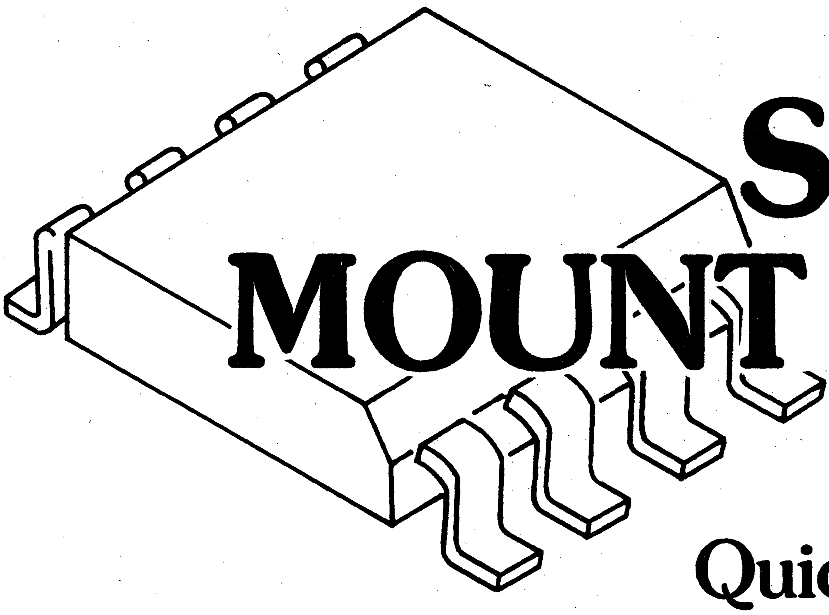
IS THIS A BORROWED COPY?

Avoid the hassle and order your own personal two-volume set of IC MASTER. It's the surest way to simplify your IC selection efforts.

Only IC MASTER allows you to examine and compare the specifications, relative strengths, and weaknesses of all devices in serious contention for your application. And only IC MASTER brings you actual manufacturers' data sheets, allowing you to make complete and definitive device selections.

You can order IC MASTER simply by charging it to your VISA or Master Card credit card. To place your order (USA only) call now: (408) 249-6800/(516) 227-1300. To order outside the USA, see list of authorized IC MASTER distributors on page 1471 of Vol. I.

WHAT'S NEW IN IC MASTER



DON'T MISS THE NEW SURFACE MOUNT DEVICE IC SECTION

Quickly shows you by base number and package, what surface mount devices are available and from which manufacturers.

Volume II, Page 5201

NEED MORE PRODUCT DETAILS?

Use the IC MASTER's NEW Telemarketing response system to request additional product information from IC manufacturers and CAE/CAD providers. CALL **800 443-0100 (EXT.) 518**

48 hour turn-around on your request . . . 24 hours a day, 7 days a week service.

IEEE Floating Point Multiplier

ADSP-3210

FEATURES

Fully Compatible with IEEE Standard 754
Three Data Formats:
- **32-Bit Single Precision Floating Point**
- **64-Bit Double Precision Floating Point**
- **32-Bit Fixed Point**

High Speed:
- **Single Precision Throughput of 100ns/10 MEGAFLOPS**
- **Double Precision Throughput of 400ns/2.5 MEGAFLOPS**
- **Fixed Point Throughput of 100ns/10MHz**

Two-Port Structure Supports Full Data Transfer Rate
One Internal Pipeline Stage
Low-Power CMOS Technology
- **400mW Max Power Dissipation**

Fully Registered I/O and Controls

GENERAL DESCRIPTION

The ADSP-3210 is a high-speed floating point multiplier. The ADSP-3210 and its companion ALU, the ADSP-3220 are basic building blocks for high-speed numerical processors. These devices offer a full set of operations on three data formats: 32-bit single-precision floating point, 64-bit double-precision floating point, and 32-bit two's complement fixed point.

Fabricated in 1.5 micron CMOS, the ADSP-3210 provides a high-speed, low-power solution to floating point multiplication requirements. Pipelined results are produced every 100ns for single precision floating point and fixed point data formats. The direct operand feed mode allows a low total latency of 310ns[1]. Pipelined double precision floating point results are produced every 400ns. Maximum power dissipation is less than 400mW, worst case.

The ADSP-3210's data formats and floating point operations conform to the proposed IEEE Standard 754. The ADSP-3210 supports all four rounding modes in the standard for all three data formats. All four exception conditions—overflow, underflow, invalid operation, and inexact result—are flagged by dedicated status pins.

The ADSP-3210 has a two-port structure: one 32-bit input port and one 32-bit output port. Two 32-bit registers are available for each of the A and B operands. Data inputs and outputs transfer at twice the cycle rate, allowing two 32-bit input operations and one 64-bit output operation on every cycle. All inputs and outputs are registered.

The ADSP-3210 is available for both commercial and military temperature ranges. Extended temperature range parts are available with high-reliability processing ("PLUS" parts). MIL-grade parts are available processed fully to MIL-STD-883, Class B.

GENERAL DESCRIPTION

The ADSP-3220 is a floating point ALU with a full complement of arithmetic, logical and data conversion operations. The ADSP-3220 and its companion multiplier, the ADSP-3210, are basic building blocks for high-speed numerical processors with operations on three data formats: 32-bit single-precision floating point, 64-bit double-precision floating point, and 32-bit two's complement fixed point.

Fabricated in 1.5 micron CMOS, the ADSP-3220 provides a high-speed, low-power solution to floating point processing requirements. Pipelined results of all operations are produced every 100ns for all data formats. The direct operand feed mode allows a low total latency of 260ns[1]. Maximum power dissipation is less than 400mW, worst case.

The ADSP-3220's data formats and floating point operations conform to the proposed IEEE Standard 754. The ADSP-3220 supports all four rounding modes in the standard for all three data formats. All four exception conditions—overflow, underflow, invalid operation, and inexact result—are flagged by dedicated status pins.

STATUS

The ADSP-3220's three-port structure accommodates the full 10 MEGAFLOPS throughput rate for double precision operations, loading two 64-bit operands on each cycle and operating internally with 64-bit wide data paths. Four input registers are available for each of the A and B operands. Each input port can load any of the eight input registers, allowing the ADSP-3220 to be configured with one input port.

The ADSP-3220 is available for both commercial and military temperature ranges. Extended temperature range parts are available with high-reliability processing ("PLUS" parts). MIL-grade parts are available processed fully to MIL-STD-883, Class B.

- **48-Pin DIP (Ceramic or Low-Cost Plastic)**

GENERAL DESCRIPTION

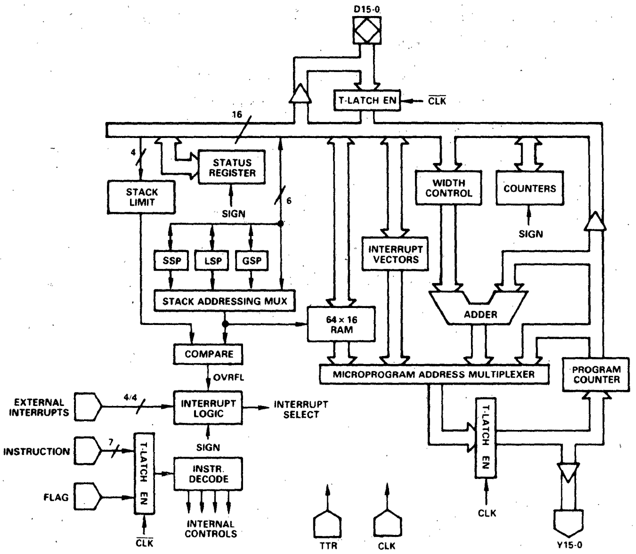
The ADSP-1401 is a high-speed microprogram controller optimized for the demanding sequencing tasks found in digital signal processors and general purpose computers (e.g. looping, jumping, branching, subroutines, condition testing and interrupts). In addition to high speed and large addressing range, it has unique features that make it highly versatile:

- on-chip control of ten prioritized and maskable interrupts
- four decrementing event counters
- absolute, relative and indirect addressing capability
- download capability (writeable control store)
- a dynamically configurable 64-word RAM.

During each micro-instruction, the ADSP-1401 monitors status indicators and the current instruction to determine the next microprogram address. This address can come from one of several sources: the stack, the jump address space in the RAM, the data port, the interrupt vectors, or the microprogram counter. An extensive set of conditional instructions is available, including jumps, branches, subroutines, interrupts, and writeable control store.

The ADSP-1401's internal 64-word RAM is used for interrupt and subroutine linkage via the stack. It also provides the ability to associate counters, jump addresses, and the status register with nested interrupts and subroutines.

ADSP-1401 PROGRAM SEQUENCER



Interrupts are handled entirely on chip. The ADSP-1401's internal interrupt control logic includes registers for eight external interrupt vectors, a mask register, and a priority decoder. Two additional vectors are reserved for internally-generated interrupts resulting from counter underflow and stack limit violation.

The ADSP-1401's four decrementing 16-bit counters are used to track loops and events. These counters are referenced by several conditional instructions and can also trigger an internal interrupt.

The ADSP-1401's Look-Ahead™ pipeline eliminates the need for an external microcode pipeline register by internally latching instructions and addresses. A complementary latching arrangement allows a new instruction to be decoded (in preparation for the following cycle) while the program memory address for the current cycle is held constant.

The ADSP-1401 is available for both commercial and military temperature ranges. Extended temperature range parts are available with high-reliability processing ("PLUS" parts). MIL-grade parts are available processed fully to MIL-STD-883, Class B. Packaging options include a 48-pin ceramic DIP and a low-cost 48-pin plastic DIP.

16-Bit Addresses with Higher Precision Options
Look-Ahead™ Pipeline
80ns Cycle Time
20ns Clock-to-Address Delay
Versatile Addressing Hardware:
  30 16-Bit Registers
  16-Bit ALU with Left/Right Shift & Carry I/O
  Comparator
  Bit Reverser
Dual Ports
Powerful Single-Cycle Looping Instructions
Low-Power CMOS Technology
  175mW Max Power Dissipation
48-Pin DIP (Ceramic or Low-Cost Plastic)

GENERAL INFORMATION

The ADSP-1410 is a fast, flexible address generator optimized for digital signal processors and general purpose computers. This low-power CMOS device rapidly generates the data memory addresses required by routines such as digital filters, FFTs, matrix operations, and DMAs.

The ADSP-1410's 10-bit microcode instructions include commands for looping, register read/writes, internal data transfers, and logical/shift operations. An internal Alternate Instruction Register (AIR) can also provide the instruction under external control, allowing microcode to be conserved in many applications.

In a single instruction cycle, the ADSP-1410 can:

- output a 16-bit memory address
- modify this memory address
- conditionally reinitialize the address based on a comparison with a preset value.

Consequently, circular buffers and modulo addressing of data memories can be implemented without overhead.

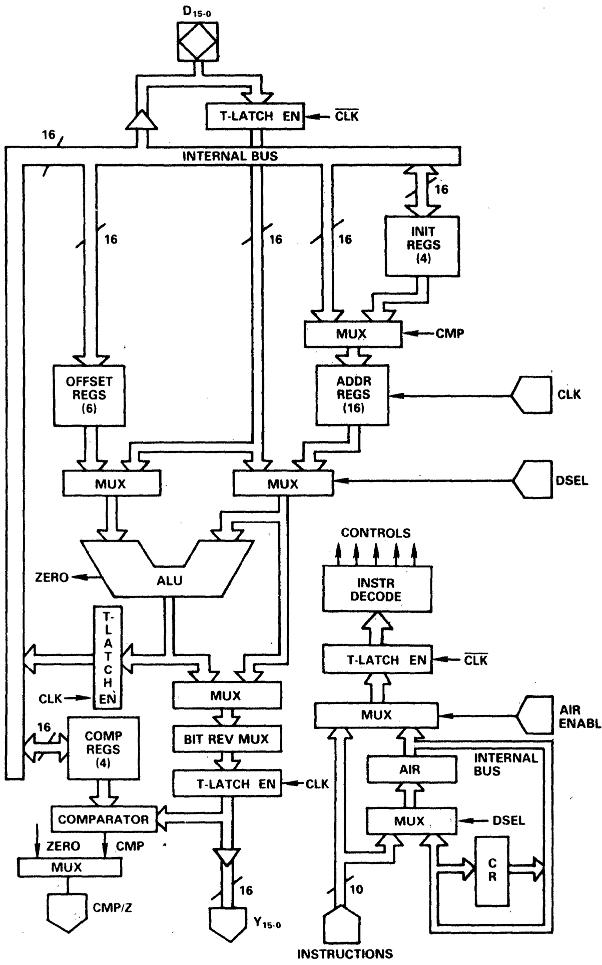
The ADSP-1410's architecture features a 16-bit ALU, a comparator, and 30 16-bit registers. The registers are organized into four files: sixteen address registers, six offset registers, four compare registers, and four initialization registers.

The ADSP-1410 has a 16-bit address (Y) port for outputting addresses and a 16-bit data (D) port for I/O between internal and external registers. A value provided by the data port may serve as an input to the 1410's ALU or may be directly output over the address port.

The ADSP-1410's Look-Ahead™ pipeline eliminates the need for an external microcode pipeline register by internally latching instructions and addresses. A complementary latching arrangement allows a new instruction to be decoded (in preparation for the following cycle) while the data memory address for the current cycle is held constant.

Double-precision (30-bit), single-cycle addressing can be performed by cascading two ADSP-1410's. Alternatively, a single ADSP-1410 can provide one double-precision address every two clock cycles.

ADSP-1410 ADDRESS GENERATOR



The ADSP-1410 is available for both commercial and military temperature ranges. Extended temperature range parts are available with high-reliability processing ("PLUS" parts). MIL-grade parts are available processed fully to MIL-STD-883, Class B. Packaging options include a 48-pin ceramic DIP and a low cost 48-pin plastic DIP.

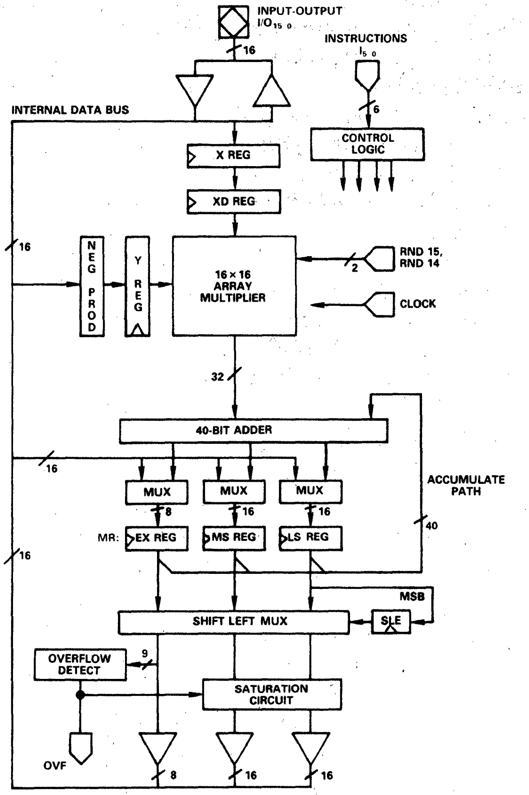
ADSP-1110A SINGLE-PORT MAC BLOCK DIAGRAM



GENERAL INFORMATION

The ADSP-1110A is a high-speed, low-power, single-port 16 × 16-bit multiplier/accumulator (MAC), with processing throughput comparable to existing three-port MACs. Its single-bus structure offers unique advantages: more compact packaging in a 28-pin DIP, simpler interface to a single bus system, and significantly reduced cost. In addition, innovative on-chip features extend the ADSP-1110A's capabilities and eliminate external hardware.

The ADSP-1110A is optimal for applications where board space is limited but high throughput is required. In addition, a microprocessor-based system can realize greater throughput by utilizing the ADSP-1110A in an accelerator.

All inputs to and outputs from the ADSP-1110A pass through its single 16-bit I/O port. All I/O operations are single cycle. A multiply or multiply/accumulate operation requires two cycles to complete—consistent with the two cycles required to load input pairs to the multiplier. An internal pipeline register enables new inputs to be loaded as the previous multiply/accumulate is computed—allowing the device's full 11.8MHz computational bandwidth to be utilized.

A six-bit microcode instruction word governs the ADSP-1110A's operation. The instruction set centers around I/O and multiply/accumulate operations. Additional instructions allow extra precision in single- and double-precision operations to be obtained efficiently.

Multiplier products are accumulated in a 40-bit wide Multiplier Result (MR) register, which consists of a 16-bit MS (Most Significant) and LS (Least Significant) register, and an 8-bit EX (Extension) register. Either multiplier input can be a two's complement or unsigned magnitude number. Overflow from the lower 32 bits of the MR into the upper eight guard bits is detected and can be monitored externally. Outputs can, conditional upon overflow status, be saturated to full scale. An MR register can be shifted left by one bit upon output; two independent controls allow rounding consistent with output formatting.

The ADSP-1110A is available for both commercial and military temperature ranges. Extended temperature range parts are available with high-reliability processing ("PLUS" parts). MIL-grade parts are available processed fully to MIL-STD-883, Class B. Packaging options include a 28-pin ceramic DIP and a low-cost 28-pin plastic DIP.

ANALOG DEVICES

CMOS Digital Multipliers

Analog Devices offers a full line of high-speed, low-power multipliers fabricated in 1.5 micron CMOS. A complete selection of industry-standard parts is available. Additional components include a 24-bit multiplier which provides added precision, and two (optionally) pipelined 16-bit multipliers which effectively double throughput.

Analog Devices multipliers are available for both commercial and military temperature ranges. Extended temperature range parts are available with high-reliability processing ("PLUS" parts). MIL-grade parts are available processed fully to MIL-STD-883, Class B. All multipliers are offered in a variety of speed grades and package types, including low-cost plastic.

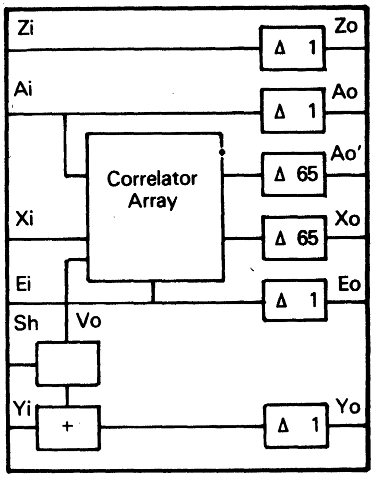
BIT-SLICE CORRELATOR

MA717

PROVISIONAL DATA

FEATURES

- * 64 stage correlation for 1-bit reference and 4 bit data.
- * 20 MHz data throughput.
- * 16 bit accumulate accuracy.
- * Expandable correlation length, reference width and data width.
- * 16 bit threshold comparator.
- * CMOS/SOS technology.



The MA717 is a 64 stage bit slice all digital correlator with 4-bit data and 1-bit reference. The design allows expansion in reference length and width and data width without the need for additional logic. The MA717 computes the correlation Y(k) between 64 reference coefficients a(i) and a data sequence x(i), expressed mathematically as

$$Y(k) = \sum_{i=0}^{63} a(i) \,.\, x(k+i)$$

The design, in CMOS/SOS technology, uses systolic techniques to provide a parallel correlation rate of 20 MHz. All internal operations are performed in 2's complement arithmetic but the data stream may be presented in either 2's complement or positive magnitude. The result is always in 2's complement and may be compared to a 2's complement 16 bit threshold level giving greater than and equal outputs.

Multiple chip applications are possible by utilizing the data expansion register and result shift together with the available data and reference outputs delayed by 1 or 65 clock cycles, and the result input and accumulate.

The MA717 has a single clock input which controls the correlation function.

Comparators

Function	Device	Features
Octal Comparator	54AC/74AC520	Expandable
Octal Comparator	54AC/74AC521	Expandable

Transceivers/Registered Transceivers

Function	Device	Registered	Enable Inputs (Level)	3-State Output
Octal Bus Transceiver	54AC/74AC245	No	1(L)	Yes
Octal Bus Transceiver	54ACT/74ACT245	No	1(L)	Yes
Octal Bus Transceiver	54AC/74AC646	Yes	1(L) & 1(H)	Yes
Octal Bus Transceiver	54AC/74AC648	Yes	1(L) & 1(H)	Yes

FIFOs

Function	Device	Input	Output	3-State Output
64 X 9 FIFO	54AC/74AC708	Parallel	Parallel	Yes
64 X 9 FIFO	54ACT/74ACT708	Parallel	Parallel	Yes

Arithmetic Functions

Function	Device	Features
16 X 16 Multiplier/Accumulator	54AC/74AC1010	2's Complement & unsigned arith.
16 X 16 Multiplier/Accumulator	54ACT/74ACT1010	2's Complement & unsigned arith.
16 X 16 Multiplier	54AC/74AC1016	2's Complement & unsigned arith.
16 X 16 Multiplier	54ACT/74ACT1016	2's Complement & unsigned arith.
16 X 16 Multiplier	54AC/74AC1017	Common Clock
16 X 16 Multiplier	54ACT/74ACT1017	Common Clock

Maximum Ratings/Recommended Operating Conditions

Absolute Maximum Ratings*

Parameter	Symbol	Conditions	Limits	Units
Supply Voltage	V_{CC}		−0.5 to 7.0	V
DC Input Diode Current or DC Input Voltage	I_{IK} V_I	$V_I = -0.5$ $V_I = V_{CC} + 0.5$	−20 20 −0.5 to V_{CC} +0.5	mA mA V
DC Output Diode Current or DC Output Voltage	I_{OK} V_O	$V_O = -0.5$ $V_O = V_{CC} + 0.5$	−20 20 −0.5 to V_{CC} +0.5	mA mA V
DC Output Source or Sink Current, Per Output Pin	I_O		±50	mA
DC V_{CC} or Ground Current	I_{CC} or I_{GND}		±200	mA
Storage Temperature	T_{STG}		−65 to 150	°C

*Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied.

Recommended Operating Conditions

Parameter		Symbol	Conditions	Limits	Units
Supply Voltage (unless otherwise specified)		V_{CC}		2.0 to 6.0	V
Input Voltage		V_I		0 to V_{CC}	V
Output Voltage		V_O		0 to V_{CC}	V
Operating Temperature	74AC 54AC	T_A		−40 to +85 −55 to +125	°C °C
Input Rise and Fall Time (except for Schmitt inputs)		t_r, t_f	V_{CC} @ 2.0 V V_{CC} @ 4.5 V V_{CC} @ 6.0 V	0 to 1000 0 to 500 0 to 400	ns ns ns

DC Characteristics for AC Family Devices

Symbol	Parameter	Conditions	V_{CC}	54AC/74AC $T_A = 25°$		54AC $T_A =$ −55° to +125°C	74AC $T_A =$ −40° to +85°C	Units
				Typ	Guaranteed Maximum			
V_{IH}	Minimum High Level Input Voltage	$V_{OUT} = 0.1$ V or $V_{CC} - 0.1$ V	3.0		2.1	2.1	2.1	V

FACT™ Ordering Information

The Product Index and Selection Guide lists only the basic device numbers. This basic number is used to form part of a simplified purchasing code where the package type and temperature range are defined as follows:

74AC 245 P C QR

Temperature Range Family
74AC = Commercial Advanced CMOS
54AC = Military Advanced CMOS
74ACT = Commercial TTL Compatible Advanced CMOS
54ACT = Military TTL Compatible Advanced CMOS

Device Type

Package Code
P = Plastic DIP
SP = Slim Plastic DIP
D = Ceramic DIP
SD = Slim Ceramic DIP
F = Flatpak
L1 = Leadless Ceramic Chip Carrier (LCC)
Q = Plastic Leaded Chip Carriers
S = Small Outline

Temperature Range
C = Commercial
M = Military

Special Variations
T = Devices shipped in 7" reels
X = Devices shipped in 14" reels
QR = Commercial grade device with burn-in shipped in tubes
TR = Commercial grade device with burn-in shipped in 7" reels
XR = Commercial grade device with burn-in shipped in 14" reels
QB = Military grade devices with environmental and with burn-in processing shipped in tubes

Package	Package Code
Plastic DIP	P
Slim Plastic DIP	SP
Ceramic DIP	D
Slim Ceramic DIP	SD
Flatpak	F
Leadless Ceramic Chip Carrier (LCC)	L1
Plastic Chip Carrier (PCC)	Q
Small Outline	S

Temperature Range	Temperature Code
Commercial −40°C to +85°C	C
Military −55°C to +125°C	M

CRC Generator/Checker

Description

The 'F401 Cycle Redundancy Check (CRC) Generator/Checker provides an advanced tool for implementing the most widely used error detection scheme in serial digital data handling systems. A 3-bit control input selects one-of-eight generator polynomials. The list of polynomials includes CRC-16 and CRC-CCITT as well as their reciprocals (reverse polynomials). Automatic right justification is incorporated for polynomials of degree less than 16. Separate clear and preset inputs are provided for floppy disk and other applications. The Error output indicates whether or not a transmission error has occurred. Another control input inhibits feedback during check word transmission. The 'F401 is fully compatible with all TTL families.

- **Eight Selectable Polynomials**
- **Error Indicator**
- **Separate Preset and Clear Controls**
- **Automatic Right Justification**
- **Fully Compatible with all TTL Logic Families**
- **14-Pin Package**
- **9401 Equivalent**
- **Typical Applications:**
  - **Floppy and Other Disk Storage Systems**
  - **Digital Cassette and Cartridge Systems**
  - **Data Communication Systems**

Functional Description

The 'F401 is a 16-bit programmable device which operates on serial data streams and provides a means of detecting transmission errors. Cyclic encoding and decoding schemes for error detection are based on polynomial manipulation in modulo arithmetic. For encoding, the data stream (message polynomial) is divided by a selected polynomial. This division results in a remainder which is appended to the message as check bits. For error checking, the bit stream containing both data and check bits is divided by the same selected polynomial. If there are no detectable errors, this division results in a zero remainder. Although it is possible to choose many generating polynomials of a given degree, standards exist that specify a small number of useful polynomials. The 'F401 implements the polynomials listed in Table 1 by applying the appropriate logic levels to the select pins S_0, S_1 and S_2.

The 'F401 consists of a 16-bit register, a Read Only Memory (ROM) and associated control circuitry as shown in the block diagram. The polynomial control code presented at inputs S_0, S_1 and S_2 is decoded by the ROM, selecting the desired polynomial by establishing shift mode operation on the register with Exclusive OR gates at appropriate inputs. To generate the check bits, the data stream is entered via the Data inputs (D), using the HIGH-to-LOW transition of the Clock input ($\overline{CP}$). This data is gated with the most significant output (Q) of the register, and controls the Exclusive OR gates (Figure 1). The Check Word Enable (CWE) must be held HIGH while the data is being entered. After the last data bit is entered, the CWE is brought LOW and the check bits are shifted out of the register and appended to the data bits using external gating (Figure 2).

To check an incoming message for errors, both the data and check bits are entered through the D input with the CWE input held HIGH. The 'F401 is not in the data path, but only monitors the message. The Error Output becomes valid after the last check bit has been entered into the 'F401 by a HIGH-to-LOW transition of $\overline{CP}$. If no detectable errors have occurred during the data transmission, the resultant internal register bits are all LOW and the Error Output (ER) is LOW. If a detectable error has occurred, ER is HIGH.

A HIGH on the Master Reset input (MR) asynchronously clears the register. A LOW on the Preset input ($\overline{P}$) asynchronously sets the entire register if the control code inputs specify a 16-bit polynomial; in the case of 12 or 8-bit check polynomials only the most significant 12 or 8 register bits are set and the remaining bits are cleared.

Serial Data Polynomial Generator/Checker

Description

The 'F402 expandable Serial Data Polynomial generator/checker is an expandable version of the 'F401. It provides an advanced tool for the implementation of the most widely used error detection scheme in serial digital handling systems. A 4-bit control input selects one-of-six generator polynomials. The list of polynomials includes CRC-16, CRC-CCITT and Ethernet, as well as three other standard polynomials (56th order, 48th order, 32nd order). Individual clear and preset inputs are provided for floppy disk and other applications. The Error output indicates whether or not a transmission error has occurred. The CWG Control input inhibits feedback during check word transmission. The 'F402 is compatible with Fairchild Advanced Schottky TTL (FAST) devices and is fully compatible with all TTL families.

- **Guaranteed 30 MHz Data Rate**

Functional Description

The 'F402 Serial Data Polynomial Generator/Checker is an expandable 16-bit programmable device which operates on serial data streams and provides a means of detecting transmission errors. Cyclic encoding and decoding schemes for error detection are based on polynomial manipulation in modulo arithmetic. For encoding, the data stream (message polynomial) is divided by a selected polynomial. This division results in a remainder (or residue) which is appended to the message as check bits. For error checking, the bit stream containing both data and check bits is divided by the same selected polynomial. If there are no detectable errors, this division results in a zero remainder. Although it is possible to choose many generating polynomials of a given degree, standards exist that specify a small number of useful polynomials. The 'F402 implements the polynomials listed in Table 1 by applying the appropriate logic levels to the select pins S_0, S_1, S_2, and S_3.

The 'F402 consists of a 16-bit register, a Read Only Memory (ROM) and associated control circuitry as shown in the Block Diagram. The polynomial control code presented at inputs S_0, S_1, S_2, and S_3 is decoded by the ROM, selecting the desired polynomial or part of a polynomial by establishing shift mode operation on the register with Exclusive OR (XOR) gates at appropriate inputs. To generate the check bits, the data stream is entered via the Data Inputs (D), using the LOW-to-HIGH transition of the Clock Input (CP). This data is gated with the most significant Register Output (RO) via the Register Feedback Input (RFB), and controls the XOR gates. The Check Word Generate (CWG) must be held HIGH while the data is being entered. After the last data bit is entered, the CWG is brought LOW and the check bits are shifted out of the register(s) and appended to the data bits (no external gating is needed).

To check an incoming message for errors, both the data and check bits are entered through the D Input with the CWG Input held HIGH. The Error Output becomes valid after the last check bit has been entered into the 'F402 by a LOW-to-HIGH transition of CP, with the exception of the Ethernet polynomial (see Applications paragraph). If no detectable errors have occurred during the data transmission, the resultant internal register bits are all LOW and the Error Output ($\overline{ER}$) is HIGH. If a detectable error has occurred, $\overline{ER}$ is LOW. $\overline{ER}$ remains valid until the next LOW-to-HIGH transition of CP or until the device has been preset or reset.

A HIGH on the Master Reset Input (MR) asynchronously clears the entire register. A LOW on the Preset Input ($\overline{P}$) asynchronously sets the entire register with the exception of:

1) The Ethernet residue selection, in which the registers containing the non-zero residue are cleared;
2) The 56th order polynomial, in which the 8 least significant register bits of the least significant device are cleared; and,
3) Register $S = 0$, in which all bits are cleared.

For information on waveforms, see Section 3 of the 1985 FAST Data Book.

Applications

In addition to polynomial selection there are four other capabilities provided for in the 'F402 ROM. The first is set or clear selectability. The sixteen internal registers have the capability to be either set or cleared when $\overline{P}$ is brought LOW. This set or clear capability is done in four groups of 4 (see Table 2, P_0-P_3). The second ROM capability (C_0) is in determining the polarity of the check word. As is the case with the Ethernet polynomial the check word can be inverted when it is appended to the data stream or as is the case with the other polynomials, the residue is appended with no inversion. Thirdly, the ROM contains a bit (C_1) which is used to select the RFB input instead of the SEI input to be fed into the LSB. This is used when the polynomial selected is actually a residue (least significant) stored in the ROM which indicates whether the selected location is a polynomial or a residue. If the latter, then it inhibits the RFB input.

As mentioned previously, upon a successful data transmission, the CRC register has a zero residue. There is an exception to this, however, with respect to the Ethernet polynomial. This polynomial, upon a successful data transmission, has a non-zero residue in the CRC register $(C7\ 04\ DD\ 7B)_{16}$. In order to provide a no-error indication, two ROM locations have been preloaded with the residue so that by selecting these locations and clocking the device one additional time, after the last check bit has been entered, will result in zeroing the CRC register. In this manner a no-error indication is achieved.

With the present mix of polynomials, the largest is 56th order requiring four devices while the smallest is 16th order requiring just one device. In order to accommodate multiplexing between high order polynomials (X 16th order) and lower order polynomials, a location of all zeros is provided. This allows the user to choose a lower order polynomial even if the system is configured for a higher order one.

The 'F402 expandable CRC generator checker contains 6 popular CRC polynomials, 2-16th Order, 2-32nd Order, 1-48th Order and 1-56th Order. The application diagram shows the 'F402 connected for a 56th Order polynomial. Also shown are the input patterns for other polynomials. When the 'F402 is used with a gated clock, disabling the clock in a HIGH state will ensure no erroneous clocking occurs when the clock is re-enabled. Preset and Master Reset are asynchronous inputs presetting the register to S or clearing to 0s respectively (note Ethernet residue and 56th Order select code 8, LSB, are exceptions to this).

To generate a CRC, the pattern for the selected polynomial is applied to the S inputs, the register is preset or cleared as required, clock is enabled, CWG is set HIGH, data is applied to D input, output data is on D/CW. When the last data bit has been entered, CWG is set LOW and the register is clocked for n bits (where n is the order of the polynomial). The clock may now be stopped if desired (holding CWG LOW and clocking the register will output zeros from D/CW after the residue has been shifted out).

To check a CRC, the pattern for the selected polynomial is applied to the S inputs, the register is preset or cleared as required, clock is enabled, CWG is set HIGH, the data stream including the CRC is applied to D input. When the last bit of the CRC has been entered, the $\overline{ER}$ output is checked: HIGH = error free data, LOW = corrupt data. The clock may now be stopped if desired.

To implement polynomials of lower order than 56th, select the number of packages required for the order of polynomial and apply the pattern for the selected polynomial to the S inputs (0000 on S inputs disables the package from the feedback chain).

Data Access Register

Description

The 'F407 Data Access Register (DAR) performs memory address arithmetic for RAM resident stack applications. It contains three 4-bit registers intended for Program Counter (R_0), Stack Pointer (R_1), and Operand Address (R_2). The 'F407 implements 16 instructions which allow either pre or post decrement/increment and register-to-register transfer in a single clock cycle. It is expandable in 4-bit increments and can operate at a 30 MHz microinstruction rate on a 16-bit word. The 3-state outputs are provided for bus-oriented applications. The 'F407 is fully compatible with all TTL families.

- **High-Speed—Greater than a 30 MHz Microinstruction Rate**
- **Three 4-Bit Registers**
- **Sixteen Instructions for Register Manipulation**
- **Two Separate Output Ports, One Transparent**
- **Relative Addressing Capability**
- **3-State Outputs**
- **Optional Pre or Post Arithmetic**
- **Expandable in Multiples of Four Bits**
- **24-Pin Slim Package**

Functional Description

The 'F407 contains a 4-bit slice of three Registers (R_0-R_2), a 4-bit Adder, a 3-state Address Output Buffer (X_0-X_3) and a separate Output Register with 3-state buffers ($\overline{O}_0$-$\overline{O}_3$), allowing output of the register contents on the data bus (refer to the Block Diagram). The DAR performs sixteen instructions, selected by I_0-I_3, as listed in the Function Table.

The 'F407 operates on a single clock. CP and $\overline{EX}$ are inputs to a 2-input, active LOW AND gate. For normal operation $\overline{EX}$ is brought LOW while CP is HIGH. A microcycle starts as the clock goes HIGH. Data inputs $\overline{D}_0$-$\overline{D}_3$ are applied to the Adder as one of the operands. Three of the four instruction lines (I_1-I_2-I_3) select which of the three registers, if any, is to be used as the other operand. The LOW-to-HIGH CP transition writes the result from the Adder into a register (R_0-R_2) and into the output register provided $\overline{EX}$ is LOW. If the I_0 instruction input is HIGH, the multiplexer routes the result from the Adder to the 3-state Buffer controlling the address bus (X_0-X_3), independent of $\overline{EX}$ and CP. The 'F407 is organized as a 4-bit register slice. The active LOW $\overline{CI}$ and $\overline{CO}$ lines allow ripple-carry expansion over longer word lengths.

In a typical application, the register utilization in the DAR may be as follows: R_0 is the Program Counter (PC), R_1 is the Stack Pointer (SP) for memory resident stacks and R_2 contains the operand address. For an instruction Fetch, PC can be gated on the X-Bus while it is being incremented (i.e. D-Bus = 1). If the fetched instruction calls for an effective address for execution, which is displaced from the PC, the displacement can be added to the PC and loaded into R_2 during the next microcycle.

Function Table

Instruction				Combinatorial Function Available on the X-Bus	Sequential Function Occurring on the Next Rising CP Edge

Programmable Counter

Description

The 'F525 is a multi-function 28-pin device. It consists of a 16-bit count-down counter, logic to control the counter, logic to control the state of the outputs and a PLA to decode the particular function selected by the user. The list of high-speed timing applications include:

- Baud Rate Generator
- Digitally Programmed Monostable
- Variable System Frequency Generator
- Digital Filter Variable Sampling Rate

XTAL	Crystal	0.5/0.375

Functional Description

The multi-function aspect of the device consists of eight different modes of operation. An explanation of the operation of the device in each of the modes follows. However, there is one operation that is independent of the selected mode, the loading of data. Data is latched into a set of data latches when $\overline{WE}$ is brought from a LOW to a HIGH state. The latches are transparent when $\overline{WE}$ is held LOW.

MODE 0

While XTR is HIGH, the data in the data latches is loaded into the counter upon the next positive-edge of CP. The negative-edge of XTR enables the count-down to begin with the next positive-edge of CP. When the count reaches zero, Q is brought HIGH and Q/2 toggles state. Taking XTR HIGH at any time causes the data in the latches to be loaded into the counter and the Q output to be cleared.

MODE 1

The operation is exactly the same as in mode 0 except that Q is normally HIGH and goes LOW on a count of zero. Q/2 toggles on the negative-edge of Q.

MODE 2

While XTR is HIGH, the data in the data latches is loaded into the counter upon the next positive-edge of CP. The negative-edge of XTR enables the count-down to begin with the next positive-edge of CP. When the count reaches zero, Q is brought HIGH for a single period of CP. Q/2 toggles state on the positive-edge of Q. Taking XTR HIGH at any time causes the data in the latches to be loaded into the counter and the Q output to be cleared.

MODE 3

The operation is exactly the same as in mode 2 except that Q is normally HIGH and goes LOW on a count of zero for a single period of CP. Q/2 toggles on the negative-edge of Q.

MODE 4

While XTR is HIGH, the data in the data latches is loaded into the counter upon the next positive-edge of CP. The negative-edge of XTR enables the count-down to begin with the next positive-edge of CP. When the count reaches zero, Q is brought HIGH for a single period of CP. Q/2 toggles state on the positive-edge of Q. Taking XTR HIGH before the counters reach zero causes the data currently in the counters to be held.

MODE 5

The operation is exactly the same as in Mode 4 except that Q is normally HIGH and goes LOW on a count of zero. Q/2 toggles on the negative-edge of Q.

MODE 6

While XTR is HIGH, the data in the data latches is loaded into the counter upon the next positive-edge of CP. The negative-edge of XTR enables both the count-down to begin and Q to go HIGH with the next positive-edge of CP. Q is brought LOW when the count reaches zero. Q/2 toggles on the positive-edge of CP. Bringing XTR HIGH during a count-down will reload the latched data into the counter, but will not affect Q.

MODE 7

The negative-edge of XTR enables the count-down to begin with the next positive-edge of CP. When the count reaches zero, Q is brought HIGH for a single period of CP. Q/2 toggles state on the positive-edge of Q. The positive-edge of CP upon which Q goes low also causes the data in the data latches to be reloaded into the counters. Taking XTR HIGH at any time causes the data in the data latches to be loaded into the counter and the Q output to be cleared. However, after an initial XTR this mode can run continuously until stopped by MR.

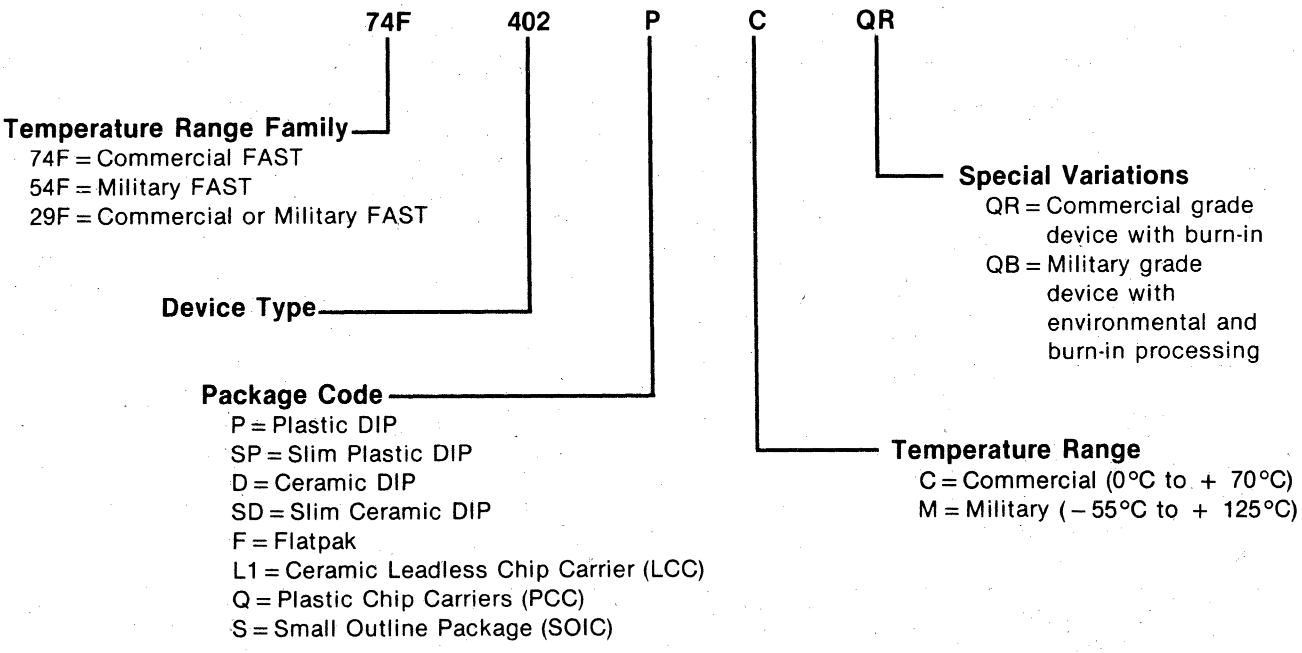
		Line Driver[6]	-100		-225			

1. Unless otherwise noted, conditions and limits apply throughout the temperature range for which the particular device type is rated. The ground pin is the reference level for all applied and resultant voltages.
2. Unless otherwise stated on individual data sheets.
3. Typical characteristics refer to $T_A = +25°C$ and $V_{CC} = +5.0$ V.
4. Min and Max refer to the values listed in the table of recommended operating conditions.
5. For I_{OS}, the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal chip heating and more accurately reflect operational values. Otherwise, prolonged shorting of a HIGH output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.
6. Refers to the type of output pull-up/pulldown circuitry used for the particular device. Standard outputs may be identified by an Output HIGH/LOW fan-out of 25/12.5 U.L.; 3-State outputs may be identified by an Output HIGH/LOW fan-out of 75/15 (12.5) U.L.; Line Driver outputs may be identified by an Output HIGH/LOW fan-out of 75/40 (30) U.L.
7. Refers to ±5% V_{CC} specifications. ±10% V_{CC} Commercial limits are the same as the Military limits.

Ordering Information

The Selection Guide lists only the basic device numbers. This basic number is used to form part of a simplified purchasing code where the package type and temperature range are defined as follows:



Temperature Range Family
74F = Commercial FAST
54F = Military FAST
29F = Commercial or Military FAST

Device Type

Package Code
P = Plastic DIP
SP = Slim Plastic DIP
D = Ceramic DIP
SD = Slim Ceramic DIP
F = Flatpak
L1 = Ceramic Leadless Chip Carrier (LCC)
Q = Plastic Chip Carriers (PCC)
S = Small Outline Package (SOIC)

Special Variations
QR = Commercial grade device with burn-in
QB = Military grade device with environmental and burn-in processing

Temperature Range
C = Commercial (0°C to + 70°C)
M = Military (−55°C to + 125°C)

F100K Logic Selection Guide

Gates and Buffers

Device	Description	# Inputs/Gate	Prop Delays*
F100101	Triple OR/NOR	5	0.95ns
F100102	Quint OR/NOR	2	0.95ns
F100104	Quint AND/NAND	2	1.40ns
F100107	Quint Exclusive OR/NOR	2	1.40ns
F100117	Triple 2-wide OR-NOR/AND/NAND	5	2.30ns
F100118	5-wide 5,4,4,4,2 OA/OAI	19	3.00ns
F100121	9-bit Inverter	1	1.25ns
F100122	9-bit Buffer	1	1.25ns
F100126	9-bit Backplane Driver	1	2.55ns

*Maximum Prop Delay at 25°C in Flatpak

Flip-Flops/Latches

Device	Description	Toggle Freq/Prop Delay*
F100130	Triple D Latch	1.50ns
F100131	Triple D Flip-Flop	350MHZ
F100150	Hex D Latch	1.20ns
F100151	Hex D Flip-Flop	375MHZ

* Minimum Fmax for Flip-Flops/Max Prop Delay for latches

Multiplexers/Demultiplexers

Device	Description	Prop Delay*
F100155	Quad Multiplexer/Latch	1.65ns
F100163	Dual 8-Input Mux	1.50ns
F100164	Single 16-Input Mux	2.15ns
F100170	Dual 1 of 4 or Single 1 of 8 Demux/Decoder	2.50ns
F100171	Triple 4-Input Mux	1.40ns

* Maximum Prop Delay at 25°C in Flatpak

Translators

Device	Description	Prop Delay*
F100124	Hex TTL-to-ECL Translator	2.70ns
F100125	Hex ECL-to-TTL Translator	3.50ns

* Maximum Prop Delay at 25°C in Flatpak

Line-Bus Drivers / Transceivers / Receivers

Device	Description	Prop Delay*
F100112	Quad Driver	1.20ns
F100113	Quad Driver	1.15ns
F100114	Quint Differential Line Receiver	1.80ns
F100123	Hex Bus Driver	2.20/4.10ns
F100194	Quint Duplex Bus Driver (Transceiver)	1.20ns

* Maximum Prop Delay at 25°C in Flatpak

Shift Registers/Counters

Device	Description	Shift Frequency
F100136	4-bit Bidirectional Shift Register or Modulo 16 up/down counter	250MHZ
F100141	8-bit Bidirectional Shift Register	300MHZ

* Minimum Fshift at 25°C in Flatpak

Arithmetic Operators

Device	Description	Prop Delay*
F100156	Mask-Merge Latch	1.60ns
F100158	8-bit Shift Matrix	2.50ns
F100160	Dual Parity Checker/Generator	3.90ns
F100165	Universal Priority Encoder	3.90ns
F100166	9-bit Comparator	3.30ns
F100179	Carry Lookahead Generator	2.70ns
F100180	High-Speed 6-bit Adder	4.40ns
F100181	4-bit Binary/BCD Arithmetic Logic Unit	6.60ns
F100182	9-bit Wallace Tree Adder	7.00ns
F100183	2 × 8-bit Recode Multiplier	3.60ns

*Maximum Prop Delay at 25°C in Flatpak

The F100104 is a monolithic quint AND/NAND gate. The Function output is the wire-NOR of all five AND gate outputs.

$F = \overline{(D_{1a} \bullet D_{2a}) + (D_{1b} \bullet D_{2b}) + (D_{1c} \bullet D_{2c}) + (D_{1d} \bullet D_{2d}) + (D_{1e} \bullet D_{2e})}$. All inputs have 50KΩ pull-down resistors.

- **Available in Ceramic DIP or Flatpak**
- **Data Input to Output Propagation Delay 1.9 ns Max**
- **Outputs Specified to Drive a 50 ΩLoad**
- **Moderate Edge Rates Minimize Ringing and Reflections on Interconnecting Wiring**

The F100121 is a monolithic 9-bit inverter. The device contains nine inverting buffer gates with single input and output. All inputs have 50KΩ pull-down resistors.

- **Available in Ceramic DIP or Flatpak**
- **Data to Output Delays of 1.6 ns Max**
- **Outputs Specified to Drive a 50 ΩLoad**
- **Moderate Edge Rates Minimize Ringing and Reflections on Interconnecting Wiring**

F100135 TRIPLE J-K FLIP-FLOP
Preliminary Information

The F100135 contains three J-K type, edge-triggered master-slave flip-flops with true and complement outputs. All have individual Clock (CP_n), Clear (C_n), and Set (S_n) inputs. Clocking occurs on the rising edge of CP_n.

- **Available in Ceramic Dip or Flatpak**
- **Propagation Delay 2.2 ns Max**
- **Toggle Frequency 350 MHz**
- **Outputs Specified to Drive a 50 ΩLoad**
- **Moderate Edge Rates Minimize Ringing and Reflections on Interconnecting Wiring**

F100139 4-BIT SYNCHRONOUS COUNTER
Preliminary Information

The F100139 is a 4-bit synchronous binary up counter. Three terminal count outputs are provided: $\overline{TC}_{15}$ goes LOW when the count reaches fifteen, TC_{14} goes HIGH when the count reaches fourteen, and $\overline{TC}_{14}$ goes LOW when the count reaches fourteen allowing connection to the active-LOW Parallel Enable inputs, $\overline{PE}_1$ or $\overline{PE}_2$, for preset operations. Active-LOW Count Enable Parallel ($\overline{CEP}$) and Count Enable Trickle ($\overline{CET}$) permit easy connection in multi-stage counting when used with $\overline{TC}_{15}$. The active-HIGH asynchronous Master Reset causes the outputs, Q_0-Q_3, to be set to the count of zero. All inputs are provided with 50KΩ pull-down resistors.

F100140 4-BIT DECADE COUNTER
Preliminary Information

The F100140 is a 4-bit synchronous decade down-counter. Three terminal count outputs are provided: $\overline{TC}_0$ goes LOW when the count reaches zero, TC_1 goes HIGH when the count reaches one, and $\overline{TC}_1$ goes LOW when the count reaches one allowing connection to the active-LOW Parallel Enable inputs, $\overline{PE}_1$ or $\overline{PE}_2$, for preset operations. Active-LOW Count Enable Parallel ($\overline{CEP}$) and Count Enable Trickle ($\overline{CET}$) permit easy connection in multi-stage counting when used with $\overline{TC}_0$. The active-HIGH asynchronous Master Reset causes the outputs, Q_0-Q_3, to be set to the count of nine. All inputs are provided with 50KΩ pull-down resistors.

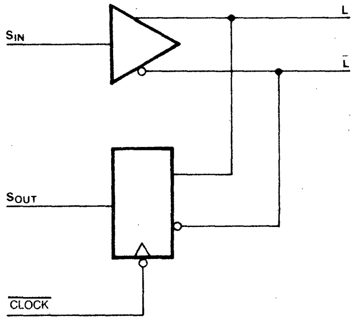
F100250 QUINT LINE TRANSCEIVER
Preliminary Information

The F100250 is a quint line transceiver capable of simultaneously transmitting and receiving differential mode signals on twisted pair line. Each transceiver has a signal input S_{IN}, a signal output SOUT and two differential line inputs/outputs L and $\overline{L}$. Signals received from the lines L and $\overline{L}$ can be stored in an internal latch. The line outputs are designed to drive 155Ω twisted lines. The $\overline{CLOCK}$ input is common to all five transceivers.



SIN

CLOCK

- **Full Duplex Operation**
- **Common Mode Noise Immunity of ±1V**
- **Maximum Line Length of 15M (with 30 AWG Wire)**
- **Available in Ceramic DIP or Flatpak**

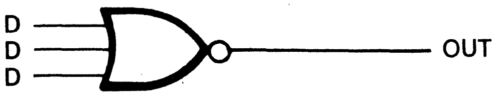
GBL GigaBit Logic

10G PicoLogic™ Family

10G000A

Quad 3 Input NOR Gate
290 ps Gate Delay

- 290 ps propagation delay
- 10G PicoLogic Family and ECL compatible inputs and outputs
- Wire-OR capability
- Supports wide range of load resistor and termination voltage combinations



¼ 10G000A

10G011A

Dual 1 to 4 Fanout Buffer
1.5 GHz Clock Rate

- 1.5 GHz clock distribution/data buffering
- 30 ps typical skew between outputs
- 10G PicoLogic and ECL-compatible inputs and outputs

GBL GigaBit Logic

10G065

7 Stage Ripple Counter 2.5 GHz Clock Rate

- 2.5 GHz operation
- 10G PicoLogic and ECL-compatible inputs and outputs
- Asynchronous clear capability on last 6 stages
- On-chip clock gating

10G060

2 Stage Ripple Counter 2.5 GHz Clock Rate

- 2.5 GHz operation
- 10G PicoLogic and ECL-compatible inputs and outputs
- Divide-by-2 and divide-by-4 outputs

10G070

Variable Modulus Divider 1.75 GHz Clock Rate

- 1.75 GHz operation
- Divide by 5 and 6, 10 and 11, 20 and 21, or 40 and 41
- 10G PicoLogic and ECL-compatible inputs and outputs
- Divide by N or N + 1 mode control timing allows use of TTL, CMOS or ECL control logic
- Wire-OR output capability

10G040/10G041

Multiplexer Demultiplexer 1.5 GHz Data Rate

- 1.50 GHz operation
- Complete multiplexer (10G040) or demultiplexer (10G041) single-chip system including sequence counter and control logic
- Cascadable for 16, 32 or 64 channel operation
- Parallel or ripple data modes
- Demux has frame sync support logic
- ECL compatible inputs and outputs
- Applications:
    - Fiber optic systems
    - Microwave datacom systems
    - Hi resolution graphic displays

16G010
16G011

15 mA/100 mA Schottky Diode Arrays

- 14 Schottky barrier diodes plus full wave rectifier on each chip
- 15 mA (16G010) and 100 mA (16G011) versions
- Exceedingly low junction capacitance
- Low series resistance
- 600 GHz typical RC cutoff frequency
- Excellent thermal and electrical matching
- Available in leadless chip carrier (LCC), flatpack or dice form

16G020
16G021

Single/Dual Gate D-MESFET Arrays

- 11 single gate (16G020) or 8 dual gate (16G021) depletion MESFETS on each chip
- 15 GHz frequency response
- −1.0V pinchoff voltage
- 24 mA I_{DSS} (typ)
- Excellent thermal and electrical matching
- Available in leadless chip carrier (LCC), flatpack or dice form

1908 Oak Terrace Lane, Newbury Park, CA 91320 (805) 499-0610 • Telex 6711358 GIGAB

12G014

256x4 Bit Pipelined Static RAM

- Nanosecond access and cycle times
- Fully pipelined architecture with latched inputs and outputs provide maximum usable speed
- Write cycle same speed as read cycle
- Internally generated write pulse eliminates need for narrow write pulse
- Register mode output for fast access with minimum cycle
- Latch mode output for fast access with extended cycle
- Single-ended or differential clock input
- ECL and 10G PicoLogic™ Family compatible
- Temperature and voltage compensation capability
- Source follower outputs permit full wire-OR capability
- Member of GigaBit Logic's 12G Gallium Arsenide NanoRam™ Family

Gallium Arsenide Foundry Program

Move Your Custom Product Designs Into The GHz Realm of Digital GaAs IC's.

- One Micron Gate Length
- Dual Layer Metal
- 4 Micron Metal Pitch
- Planarized Dielectric
- High Yield DSW Lithography
- Fully Implanted Active Layers
- 3 Inch LEC Starting Material
- Sputtered/Plasma Thin Films
- All "Dry" Processing
- High Volume Production Capability
- Digital Logic to 4 GHz
- Analog/RF Functions to 5 GHz
- Static RAM to 1 NS Access
- Supports CDFL, SDFL, BFL, SCFL
- 200 uW to 3 mW/Gate Design Range
- ECL Compatible I/O Available
- Sub 100 PSEC Gate Delays
- Compatibility with E-MESFET

Evaluation Products

10GEVAL Evaluation Board

- Accelerates evaluation of GigaBit's 10G PicoLogic™ Gallium Arsenide IC's
- Provides a state-of-the-art educational training tool on digital GaAs ICs
- Contains five PicoLogic™ GaAs ICs:
  - One 10G065-3, 7 Stage Ripple Counter
  - Four 10G011-4 dual 1-to-4 Fanout Buffers
- Complete with two on-board oscillators:
  - 1.5 to 2.1 GHz sinewave VCO
  - Up to 500 MHz square wave ring oscillator
- 24 SMA connectors and cables allow flexible test equipment interface
- Comprehensive 135 page User's Manual documents tests and experiments and contains valuable background material on GaAs logic
- Simple external power supply requirements: +10V and −5V
- Housed in a rugged metal carrying case
- Fully assembled and tested

10GPDK Prototype Development Kit

- Complete kit for prototyping and testing GigaBit's PicoLogic™ and NanoRam™ Gallium Arsenide ICs
- Contains an 8-site logic PCB with all necessary SMAs, terminating resistors, decoupling capacitors and mini-coax for interconnect wiring, plus a mating power supply board
- Kit components available separately for expanded applications
- Low cost, quick turnaround solution to initial device performance testing and evaluation needs
- 90G100 8-site logic card mates with the power supply board in GigaBit's 10GEVAL Evaluation Board, extending 10GEVAL capabilities
- Compatible with either GigaBit' standard 36 I/O flatpack or leadless chip carrier packages
- Power supply card (10GBPS) is fully assembled and tested
- 90G100 accepts up to 34 SMA I/O connectors
- Supports signals with 100ps rise and fall times and up to 3 GHz clock rates

GaAs Digital IC Products

HARRIS MICROWAVE SEMICONDUCTOR

NEW FOUR-BIT UNIVERSAL SHIFT REGISTER: HMD-12141-1

☐ 1.30 GHz Typical Clock Speed
☐ Propagation Delay of 700 ps Typical
☐ Shift Right, Shift Left, Parallel, or Hold
☐ Serial or Parallel Inputs and Outputs
☐ ECL Compatible & GaAs Compatible Inputs and Outputs
☐ 32-Pin Metal Flatpack Design

DIVIDE BY 2/4/8 BINARY COUNTER: HMD-11016-1

☐ 2.0 GHz Data Input Rate
☐ Synchronous Operation with Simultaneous Divide by 2, 4 and 8 Outputs
☐ ECL Compatible & GaAs Compatible Inputs and Outputs
☐ Extended Temperature Range: -55°C to +85°C
☐ 50 Ohm Impedance System Operation
☐ Asynchronous Master Clear and Enable for Down Counter Operation

DIGITAL SIGNAL PROCESSING IC PRODUCTS - SSI
3 GHz

☐ Master/Slave D Flip-Flop: HMD-11131-2
☐ Divide by Two/Prescaler: HMD-11301-2
☐ 5-Input NAND/AND Gate: HMD-11104-2
☐ 5-Input NOR/OR Gate: HMD-11101-2
☐ Dual 2-Input Exclusive OR Gate: HMD-11113-2
☐ Ultra High-Speed Comparator: HMD-11685-2 (Contact Factory Regarding Availability)

SIGNAL PROCESSING IC PRODUCTS - MSI

☐ Divide by 10/11 Variable Modulus Divider: HMD-11011-2
☐ Programmable Pulse Driver/Formatter: HMD-11502-2

(Contact Factory Regarding Availability)

GaAs DIGITAL IC EVALUATION KITS

☐ SSI IC Evaluation Kit for 16-pin packages: HMK-11SSI-2
☐ MSI IC Evaluation Kit for 32-pin packages: HMK-11MSI-1
☐ MSI Semi-custom/Custom IC Evaluation Kit for 48-pin packages: HMK-11MSI-3

GaAs CELL ARRAYS™ AND CUSTOM PRODUCTS

☐ MSI Level Semi-custom and Custom GaAs IC Designs
☐ Up to 300/Equivalent Gate Complexity Logic Designs

(Contact Factory For Details)

PACKAGING

☐ All parts are available in Hermetic Metal Flatpack packages
☐ The MSI Integrated Circuits are in 32-pin packages
☐ The SSI Integrated Circuits are in 16-pin packages
☐ The Cell Array is packaged in 48-pin Packages

Printed in U.S.A.

FEATURES

- ☐ 2.0 GHz data input rate
- ☐ ECL compatible and GaAs compatible I/Os
- ☐ Synchronous operation with simultaneous divide by 2, 4, and 8 outputs
- ☐ Asynchronous master clear and enable for down counter operation
- ☐ 50 ohm impedance system operation
- ☐ Single ended input/output
- ☐ Metal flatpack packaging for optimum performance in GHz transmission systems
- ☐ Reliable Ti/Pt/Au metallization system
- ☐ Temperature range: -55°C to +85°C

GENERAL DESCRIPTION

The HMD-11016-1 is a Gallium Arsenide Digital Integrated Circuit which has been designed by Harris Microwave Semiconductor to perform binary counter and fixed divide functions at input data rates in excess of those available with silicon-based units. Capable of specified performance over an expanded temperature range, the HMD-11016-1 performs fixed divide by two, four, and eight, and supplies these three outputs simultaneously to facilitate bit-steering applications. A data enable input permits the unit to be used as a (count down) binary counter.

Its compatibility with ECL and other GaAs products afford its use in a broad range of signal processing applications previously only possible at reduced throughput rates. Housed in a hermetic package designed to minimize parasitic and cross talk performance degradation, the HMD-11016-1 is suitable for use in applications requiring subnanosecond system response times and reliable operation.

The HMD-11016-1 is a member of the Harris Microwave Semiconductor HMD-11 family of small and medium scale GaAs ICs.

FUNCTION DESCRIPTION

The HMD-11016-1 contains five D-type flip-flops. These flip-flops are fully synchronous and are driven in parallel through Data In. The HMD-11016-1 acts as a binary counter 2/4/8 divider which accepts data inputs at frequencies up to 1800 MHz minimum. The first flip-flop is used as a binary element for the divide-by-two function with outputs at one half data rate input. The remaining flip-flops are used to develop the divide-by-eight output. The divide-by-four function is derived from the different internal phases of the divide-by-eight function with an output at one-fourth the data rate input. A separate reference voltage, V_{REF} (with ≤10 μA) must be supplied to the device. This reference voltage will provide input tuning capability for maximum frequency response, including performance across temperature ranges. V_{REF} is typically -1.2 V, but can be adjusted to optimize device performance.

DC CHARACTERISTICS: V_{DD} = +5.0 V, V_{SS} = -3.5 V

SYMBOL	PARAMETERS	LIMITS TYP	UNITS	CONDITIONS T_A = 25°C

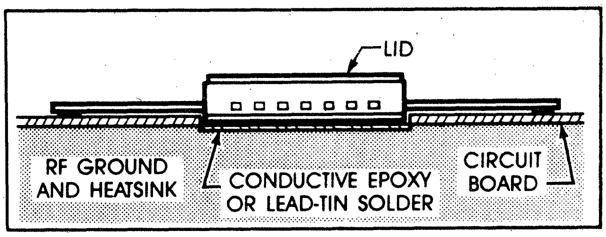
T_{CASE}	Case Base Temperature Range	-55°C to +85°C

1. Permanent damage may result from operation at conditions beyond maximum ratings.

IC MOUNTING PROCEDURES

It is imperative that adequate heatsinking of the IC package be provided in the application circuit. The chip is die attached directly to the bottom of the case, and both the bottom and lid are grounded.

- The primary avenue for heat removal is through the bottom of the case to a heatsink at ground potential. Voids and gaps in the contact between the case and the heatsink are to be avoided.
- An electrically conductive attachment material is recommended. A conductive epoxy, such as Abel Stick 36-2, 88-1 (or equivalent), or a lead-tin solder (with flux) may be used.
- Supplemental heatsinking for the case lid and forced air cooling can lower the device temperature further.



IC HANDLING PROCEDURES

Permanent damage to the device can result from inadequate protection against excessive voltages on the device due to static charge buildup, test equipment transients and inductive pickup. Grounding of equipment and personnel during the handling and testing of GaAs ICs, and control of the unit's test conditions and environment, should be standard procedures.

Elimination or reduction of damage due to static charge or other causes can be accomplished as follows:

- Use conductive work stations. Metallic or conductive plastic tops on work benches connected to ground help eliminate static buildup.
- Ground all handling equipment and soldering iron tips.
- Ground all handling personnel with a conductive bracelet through 1M ohm to ground. The 1M ohm resistor helps protect the handler from electroshock.
- Certain materials, highly dielectric in nature, will hold or aid in the generation of a static charge. Smocks, clothing, and shoes of these insulating materials (notably nylon) should not be worn in areas where devices are handled. Natural materials such as cotton, etc. should be used to minimize charge generation capacity.
- Control relative humidity to as high a level as practical (RH 50%).
- Ionized air blowers reduce charge buildup in areas where ground is not possible or desirable.
- Devices should be in conductive carriers during all phases of transport. Leads may be shorted by metallic carriers, conductive foam or foil.
- Mount and remove GaAs ICs with power removed.
- Do not exceed the maximum product ratings specified.

APPLICATIONS INFORMATION

- All unused device inputs should be connected to RF ground to prevent electrostatic charge damage.
- In order to prevent high frequency oscillations, a 0.1μf capacitor is recommended between the IC's ground and voltage supplies.
- It is recommended that for best performance, microstrip, stripline or coplanar transmission lines be used.
- When driving ECL, stub lengths can be extended up to 1 inch. The termination resistor should be connected to -3.5 volts for full ECL. A -2 volt supply can also be used for a lower amplitude output.
- When laying out components, the designer must meet two conditions. First, R_T must terminate the transmission line at only one point. Second, any unterminated stub lengths must be kept under 0.25 inches for driving GaAs circuits.
- V_{REF} of -1.2 V ±0.2 V must be supplied to the GaAs devices in order to fine-tune their maximum Data In performance, including performance across operating temperature range.
- IC inputs and outputs are matched for use with 50 ohm impedance systems (35 to 65 ohms). Output lines can drive 35 to 65 ohms terminating resistor loads and up to 1 pf of capacitance (at 125 ps rise and fall times).

FEATURES

- ☐ 1.3 GHz clock speed
- ☐ ECL compatible and GaAs compatible I/Os
- ☐ Serial or parallel I/O
- ☐ Shift right, shift left, parallel, or hold
- ☐ Flatpack packaging for optimum performance in GHz transmission systems
- ☐ Reliable Ti/Pt/Au metallization system

GENERAL DESCRIPTION

The HMD-12141-1 is a Gallium Arsenide Digital Integrated Circuit which has been designed by Harris Microwave Semiconductor to perform shift register functions at clock rates in excess of those available with ECL products. Capable of specified performance over an expanded temperature range, the HMD-12141-1 performs shift right, shift left, serial/parallel in, serial/parallel out and hold operations using the on-chip decoder.

Its serial/parallel processing capability, combined with its compatibility with ECL and other GaAs products afford its use in a broad range of signal processing applications previously only possible at reduced throughput rates.

Housed in a hermetic package designed to minimize parasitic and cross talk performance degradation, the HMD-12141-1 is suitable for use in applications requiring subnanosecond system response times and reliable operation.

The HMD-12141-1 is a member of the Harris Microwave Semiconductor HMD family of small and medium scale GaAs ICs.

Logical LOW = -1.8 V to -2.0 V

Figure 1

FUNCTION DESCRIPTION

The HMD-12141-1 contains four clocked D-type flip-flops with individual inputs (P_n) and outputs (Q_n) for parallel operation, and with serial inputs (D_n) and steering logic for bidirectional shifting. The flip-flops accept input data one set-up time before the positive going transition of the clock pulse, and their outputs respond one propagation delay after this rising clock edge.

The circuit operating mode is determined by the Select inputs S_0 and S_1, which are internally decoded to select either "parallel entry," "hold," "shift left" or "shift right" as described in the Truth Table. In normal operating mode, the clear is set at -0.8 V. Clear is operated by the waveform shown in Figure 3.

Integrated Device Technology, Inc

FAST™ CMOS COMPATIBLE (FCT) LOGIC SERIES

IDT54/74FCT

FEATURES:

- Equivalent to FAST™ speeds and output drive over full temperature and voltage supply extremes
- CMOS power levels (5μW typ. static)
- Both CMOS and TTL output compatible
- Substantially lower input current levels than FAST™ (5μA max.)
- 100% product assurance screening to MIL-STD-883, Class B is available
- JEDEC standard pinout for DIP and LCC

DESCRIPTION:

The "FCT" series is a family of industry standard memory interface circuits that are pin compatible, functional equivalent replacements to the Fairchild FAST™ series, but at CMOS power levels (1/10 operation, 1/100 standby).

DC ELECTRICAL CHARACTERISTICS OVER OPERATING RANGE

Following Conditions Apply Unless Otherwise Specified:

T_A = 0°C to +70°C V_{CC} = 5.0V ± 5% Min. = 4.75V Max. = 5.25V (Commercial) V_{LC} = 0.2V
T_A = -55°C to +125°C V_{CC} = 5.0V ± 10% Min. = 4.50V Max. = 5.50V (Military) V_{HC} = V_{CC} - 0.2V

SYMBOL	PARAMETER	TEST CONDITIONS[1]		MIN.	TYP.[2]	MAX.	UNIT

CMOS PARALLEL FIRST-IN/FIRST-OUT FIFO 512 x 9 BIT & 1024 x 9 BIT

IDT7201S/L
IDT7202S/L

FEATURES:

- First-In, First-Out dual port memory
- 512x9 organization (IDT7201)
- 1024x9 organization (IDT7202)
- Low power consumption
  - —IDT7201/7202S Commercial:
    Active: 440mW
    Power Down: 16.5mW (Max.)
  - —IDT7201/7202S Military:
    Active: 550mW
    Power Down: 27.5mW (Max.)
  - —IDT7201/7202L Commercial:
    Active: 440mW (Max.)
    Power Down: 2.7mW (Max.)
  - —IDT7201/7202L Military:
    Active: 550mW (Max.)
    Power Down: 5mW (Max.)
- Asynchronous and simultaneous read and write
- Fully expandable by both word depth and/or bit width
- IDT7201 pin and functionally compatible with Mostek MK4501
- IDT7202 allows for deep word structure (1024) without expansion
- Half full flag capability in single device mode
- Master/slave multiprocessing applications
- Bidirectional and rate buffer applications
- Empty and full warning flags
- Auto retransmit capability
- High-performance CEMOS™ II technology
- Available in DIP and LCC
- Military product available 100% screened to MIL-STD-883, Class B

DESCRIPTION:

The IDT7201/7202 is a dual port memory that utilizes a special First-In, First-Out algorithm that loads and empties data on a first-in, first-out basis. The device uses full and empty flags to prevent data overflow and underflow and expansion logic to allow for unlimited expansion capability in both word size and depth.

The reads and writes are internally sequential through the use of ring pointers, with no address information required to load and unload data. Data is toggled in and out of the device through the use of the WRITE ($\overline{W}$) and READ ($\overline{R}$) pins. The device has a read/write cycle time of 65ns (15MHz).

The device utilizes a 9-bit wide data array to allow for control and parity bits at the user's option. This feature is especially useful in data communications applications where it is necessary to use a parity bit for transmission/reception error checking. It also features a RETRANSMIT ($\overline{RT}$) capability that allows for reset of the read pointer to its initial position when $\overline{RT}$ is pulsed low to allow for retransmission from the beginning of data. A half full flag is available in the single device mode and width expansion modes.

The IDT7201/7202 is fabricated using the high speed CEMOS™ II, 2 micron technology and is available in DIP and LCC screened to MIL-STD-883, Method 5004. It is designed for those applications requiring asynchronous and simultaneous read/writes in multiprocessing and rate buffer applications. The 1024x9 organization of the IDT7202 allows a 1024 deep word structure without the need for expansion.

IDT7M203
IDT7M204

FEATURES:

- First-In, First-Out memory module
- 2Kx9 organization (IDT7M203)
- 4Kx9 organization (IDT7M204)
- Low power consumption
- Asynchronous and simultaneous read and write
- Fully expandable by both word depth and/or bit width
- Assembled with IDT's high-reliability vapor phase solder reflow process
- Single 5V (±10%) power supply
- Master/slave multiprocessing applications
- Bidirectional and rate buffer applications
- Empty and full warning flags
- High-performance CEMOS™II technology
- Pin compatible with Mostek MK4501 and IDT7201, but with four times word depth (IDT7M203) or eight times (IDT7M204)
- Module available with semiconductor components 100% screened to MIL-STD-883, Class B

DESCRIPTION:

The IDT7M203/204 are FIFO memory modules that utilize a special First-In, First-Out algorithm that loads and empties data on a first-in, first-out basis. The device uses full and empty flags to prevent data overflow and underflow and expansion logic to allow for unlimited expansion capability in both word size and depth.

The reads and writes are internally sequential through the use of ring pointers, with no address information required to load and unload data. Data is toggled in and out of the device through the use of the WRITE ($\overline{W}$) and READ ($\overline{R}$) pins. The device has a read/write cycle time of 85ns (12MHz).

The device utilizes a 9-bit wide data array to allow for control and parity bits at the user's option. This feature is especially useful in data communications applications where it is necessary to use a parity bit for transmission/reception error checking.

The IDT7M203/204 are constructed on a multi-layered ceramic substrate using four IDT7201 (512x9) or four IDT7202 (1Kx9) FIFOs in leadless chip carriers. Extremely high speeds are achieved in this fashion due to the use of IDT7201s and IDT7202s fabricated in IDT's high-performance 2 micron technology, CEMOS II.

IDT's military FIFO modules have semiconductor components 100% processed to the test methods of MIL-STD-883, Class B, making them ideally suited to applications demanding the highest level of performance and reliability.

16 x 16 PARALLEL CMOS MULTIPLIER-ACCUMULATOR

PRELIMINARY
IDT7210
IDT7243

FEATURES:

- 16 x 16 parallel multiplier/accumulator with selectable accumulation and subtraction
- High-speed - 65ns multiply/accumulate time
- IDT7210 features selectable accumulation, subtraction, rounding and preloading with 35-bit result
- IDT7243 features selectable accumulation, subtraction and rounding with 19-bit result
- IDT7210 is pin and functionally compatible with the TRW TDC1010J
- IDT7243 is pin and functionally compatible with the TRW TDC1043
- Both devices perform subtraction and double precision addition and multiplication
- Produced using advanced sub-2 micron CEMOS™II high-performance technology
- Low power consumption (less than 250mW typical) - less than 1/15 the power of compatible bipolar and 1/7 the power of NMOS designs
- Inputs and outputs directly TTL-compatible
- Single 5V supply
- Available in DIP or LCC
- Military product 100% screened to MIL-STD-883, Class B

DESCRIPTION:

The IDT7210/7243 are high-speed, low-power 16 x 16 bit parallel multiplier/accumulators that are ideally suited for real-time digital signal processing applications. Fabricated using sub-2 micron CEMOS II silicon gate technology, these devices offer a very low power alternative to existing bipolar and NMOS counterparts with only 1/7 to 1/15 the power dissipation and exceptional speed (65ns maximum) performance.

Pin and functional replacements for TRW's TDC1010J/TDC-1043, the IDT7210/7243 operate from a single 5 volt supply and are compatible with standard TTL logic levels. The architecture of the IDT7210/7243 is fairly straightforward, featuring individual input and output registers with clocked D-type flip-flops, a pre-load capability (IDT7210 only) which enables input data to be preloaded into the output registers, individual three-state output ports for the extended product (XTP) and most significant product (MSP), and a least significant product output (LSP) which is multiplexed with the Y input. Unlike the IDT7210 the IDT7243 does not have either a preload capability or a Least Significant Product (LSP) Output.

IDT7209

DESCRIPTION:

The IDT7209 is a high-speed, low-power 12x12 bit parallel multiplier/accumulator that is ideally suited for real-time digital signal processing applications. Fabricated using sub-2 micron CEMOS II silicon gate technology, this device offers a very low power alternative to existing bipolar and NMOS counterparts with only 1/7 to 1/15 the power dissipation and exceptional speed (55ns maximum) performance.

A pin and functional replacement for TRW's TDC1009J, the IDT7209 operates from a single 5 volt supply and is compatible with standard TTL logic levels. The architecture of the IDT7209 is fairly straightforward, featuring individual input and output registers with clocked D-type flip-flops, a preload capability which enables input data to be preloaded into the output registers, individual three-state output ports for the extended product (XTP) and most significant product (MSP), and a least significant product (LSP) output.

The X_{IN} and Y_{IN} data input registers may be specified through the use of the two's complement input (TC) as either two's complement or an unsigned magnitude, yielding a full-precision 24-bit result that may be accumulated to a full 27-bit result. The three output registers—extended product (XTP), most significant product (MSP) and least significant product (LSP)—are controlled by the respective TSX, TSM and TSL input lines.

The accumulate input (ACC) enables the device to perform either a multiply or a multiply-accumulate function. In the multiply-accumulate mode, output data can be added to or subtracted from subsequent results. When the subtraction (SUB) input is active simultaneously with an active ACC, a subtraction can be performed. The double precision accumulated result is rounded down to either a single precision or single precision plus 3-bit extended result. In the multiply mode, the extended product output (XTP) is sign extended in the two's complement mode or set to zero in the unsigned mode. The ROUND (RND) control rounds up the most significant product (MSP) and the 3-bit extended product (XTP) outputs. When preload input (PREL) is active, all the output buffers are forced into a high-impedance state (see PRELOAD truth table) and external data can be loaded into the output register by using the TSX, TSL and TSM signals as input controls.

16x16 BIT PARALLEL CMOS MULTIPLIER

IDT7216L
IDT7217L

FEATURES:

- 16x16 parallel multiplier with double precision product
- High-speed 55ns maximum clock to multiply time
- Low power consumption - 200mW typical, less than 1/10th the power of compatible bipolar parts
- Produced with advanced CEMOS™ I high-performance technology
- IDT7216L is pin and functionally compatible with TRW MPY016H/K and AMD AM29516
- IDT7217L requires only single clock with register enables making it pin and functionally compatible with AMD AM29517
- Configured for easy array expansion
- User-controlled option for transparent output register mode
- Round control for rounding the MSP
- Single 5V power supply
- Input and output directly TTL-compatible
- Three-state output
- Available in DIP, LCC or Flatpack
- Military product available 100% screened to Class B

DESCRIPTION:

The IDT7216/IDT7217 are high-speed, low-power 16x16 multipliers, ideal for fast, real time digital signal processing applications. Utilization of a modified Booths algorithm and IDT's high-performance, high-reliability technology, CEMOS I, has achieved speeds comparable to bipolar (55ns max.) at 1/10th the power consumption.

The IDT7216/IDT7217 are ideal for applications requiring high-speed multiplications such as fast Fourier transform analysis, digital filtering, graphic display systems, speech synthesis and recognition, and in any system requirement where multiplication speeds of a mini/micro computer are inadequate.

All input registers, as well as LSP and MSP output registers, use the same positive edge triggered D-type flip-flop. In the IDT7216, there are independent clocks (CLKX, CLKY, CLKM, CLKL) associated with each of these registers. The IDT7217 has only a single clock input (CLK) and three register enables. $\overline{\text{ENX}}$ and $\overline{\text{ENY}}$ control the two input registers, while $\overline{\text{ENP}}$ controls the entire product.

The IDT7216/IDT7217 offer additional flexibility with the FA control and $\overline{\text{MSPSEL}}$ functions. The FA control formats the output for 2's complement by shifting the MSP up one bit and then repeating the sign bit in the MSB of the LSP. The $\overline{\text{MSPSEL}}$ low selects the MSP to be available at the product output port, while a high selects the LSP to be available. Keeping this pin low will ensure compatibility with the TRW MPY016H/K.

The IDT7216/IDT7217 Multipliers are 100% processed in compliance to the test methods of MIL-STD-883, Method 5004, making them ideally suited to applications demanding the highest level of performance and reliability.

12 x 12 BIT PARALLEL CMOS MULTIPLIER

PRELIMINARY
IDT7212
IDT7213

FEATURES:

- 12x12 parallel multiplier with double precision product
- High-speed - 45ns maximum clock to multiply time
- Low power consumption - 250mW typical, less than 1/10th the power of compatible bipolar parts
- Produced with advanced sub-2 micron CEMOS™ II dual-layer metal high-performance technology
- IDT7212L is pin and functionally compatible with TRW MPY012H
- IDT7213L requires only a single clock with register enables
- Configured for easy array expansion
- User-controlled option for transparent output register mode
- Round control for rounding the MSP
- Single 5V power supply
- Input and output directly TTL-compatible
- Three-state output
- Available in DIP, LCC or Flatpack
- Military product available 100% screened to MIL-STD-883, Class B

DESCRIPTION:

The IDT7212/IDT7213 are high-speed, low power 12x12 multipliers ideal for fast, real-time digital signal processing applications. Utilization of a modified Booths algorithm and IDT's high-performance, high-reliability technology, CEMOS II, has achieved speeds exceeding bipolar (45ns max.) at 1/10th the power consumption.

The IDT7212/IDT7213 are ideal for applications requiring high-speed multiplications such as fast Fourier transform analysis, digital filtering, graphic display systems, speech synthesis and recognition, and in any system requirement where multiplication speeds of a mini/micro computer are inadequate.

All input registers, as well as LSP and MSP output registers, use the same positive edge triggered D-type flip-flop. With the IDT7212, there are independent clocks (CLKX, CLKY, CLKM, CLKL) associated with each of these registers. The IDT7213 has only a single clock input (CLK) and three register enables. $\overline{\text{ENX}}$ and $\overline{\text{ENY}}$ control the two input registers, while $\overline{\text{ENP}}$ controls the entire product.

The IDT7212/IDT7213 offer additional flexibility with the FA control. The FA control formats the output for 2's complement by shifting the MSP up one bit and then repeating the sign bit in the MSB of the LSP.

The IDT7212/IDT7213 Multipliers are 100% processed in compliance to the test methods of MIL-STD-883, Method 5004, making them ideally suited to applications demanding the highest level of performance and reliability.

Timers/Counters Without Display Drivers

TYPE	SPECIAL FEATURES	DESCRIPTION
ICM7555		Low power CMOS equivalent of industry standard 555 timer—only 80μA supply current. ICM7555 does not have the large supply current transients of the bipolar 555 and does not require the large bypassing capacitors needed by the 555. Low leakage threshold and trigger inputs allow use of higher impedance RC timing components for extra long time delays.
ICM7556		An ICM7556 is a dual ICM7555, a CMOS, low power equivalent of the Bipolar 556 Timer.
ICM7240	Binary 0-225	Programmable CMOS counter/timer. Uses on-board RC oscillator or an external clock. The count is programmed by wire-AND connection of the outputs. Excellent for ON/OFF delay timers, ÷ N counters, and long period delays.
ICM7250	BCD 0-99	
ICM7260	Time 0-59	
ICM7242	Fixed 128/255	RC oscillator + 8-bit counter, similar to ICM7240 but with fixed 256 count. Used for extremely long time delays. Cascadable.

Oscillator/Divider Selector Guide

TYPE	OUTPUT FREQUENCY	SUPPLY VOLTAGE (V)	TYPICAL CURRENT (μA)	PULSE WIDTH (ms)	CRYSTAL FREQUENCY	OTHER OUTPUTS/COMMENTS
ICM7213	1 Pulse/Min	2-4	100	125, 1000	4.19 MHz	1 Pulse/Sec, 2048, 1024, 34.133, 16 Hz

LATTICE

L1010

HIGH SPEED 16 × 16-BIT CMOS MULTIPLIER/ACCUMULATOR

FEATURES

- 16 × 16 MULTIPLIER/ACCUMULATOR WITH DOUBLE PRECISION PRODUCT
- HIGH SPEED MULTIPLY — ACCUMULATE
  - — 45 ns Max Clocked Multiply Time
- LOW POWER CMOS TECHNOLOGY
  - — 550 mW Max (active)
  - — 550 μW Max (CMOS Standby)
- SIMPLE INTERFACE
  - — Single 5V ± 10% Supply
  - — TTL Compatible Inputs and Outputs
- 35-BIT ACCUMULATION
  - — Round-off Control of MSP Term
  - — Accumulator Can Be Pre-Loaded
- TWO'S COMPLEMENT AND UNSIGNED MAGNITUDE MULTIPLICATION
- PIN COMPATIBLE, HIGH PERFORMANCE REPLACEMENT FOR TRW 1010J, AMD 29510

DESCRIPTION

The LATTICE L1010 devices are high performance 16 × 16-bit double precision multiplier/accumulators. Designed with high speed circuit techniques and a modified Booth's algorithm, the devices feature 45 ns, 65 ns, and 90 ns multiply-accumulate times. These devices offer a performance upgrade and are pin compatible with industry standard multipliers like the TRW 1010J.

UltraMos™, LATTICE's high performance CMOS technology, provide the multipliers with an active power dissipation of 550 mW maximum and a low CMOS standby power consumption of 550 μW maximum.

The L1010 multiplier/accumulators generate a 32-bit product from two 16-bit input busses. The input data can be specified as unsigned magnitude or two's complement, by controlling the state of the TC line. The output of the 32-bit multiplier array is zero-filled or sign extended out to the 35th bit, to provide a 35-bit input into the accumulator.

The accumulator has these functions: add the product to the accumulator, subtract the accumulator from the product, pass the product to accumulator, and preload from external data.

L1016

HIGH-SPEED 16 × 16 BIT CMOS MULTIPLIER

FEATURES

- 16 × 16 MULTIPLIER — DOUBLE PRECISION PRODUCT
- HIGH SPEED MULTIPLY
  - — 45 ns Max Clocked Multiply Time
- LOW POWER CMOS TECHNOLOGY
  - — 550 mW Max (active)
  - — 550 μW Max (CMOS Standby)
- SIMPLE INTERFACE
  - — Single 5V ± 10% Supply
  - — TTL Compatible Inputs and Outputs
- ROUND-OFF CONTROL OF MSP TERM
- TWO'S COMPLEMENT AND UNSIGNED MAGNITUDE MULTIPLICATION
- PIN COMPATIBLE, HIGH PERFORMANCE REPLACEMENT FOR TRW MPY016HJ, AMD 29516
- AVAILABLE IN DIP OR LCC PACKAGES

DESCRIPTION

The LATTICE L1016 devices are high performance 16 × 16 bit double precision multipliers. Designed with high speed circuit techniques and a modified Booth's algorithm, the devices feature 45 ns, 65 ns, and 90 ns multiply times. These devices offer a performance upgrade and are pin compatible with industy standard multipliers like the MPY016HJ.

UltraMos™, LATTICE's high performance CMOS technology, provide the multipliers with an active power dissipation of 550 mW maximum and a low CMOS standby power consumption of 550 μW maximum.

The L1016 multipliers generate a 32-bit product from two 16-bit input busses. The input data can be specified as unsigned magnitude or two's complement, by controlling the state of the C_x and C_y mode lines. Mixed input modes are also permitted. The most significant half of the product (MSP) is available on the 16-bit output port. The least significant half (LSP) is multiplexed with MSP and is available at either the 16-bit output port or the Y input port.

LATTICE L1017

HIGH SPEED 16 × 16-BIT CMOS MULTIPLIER

FEATURES

- 16 × 16 MULTIPLIER — DOUBLE PRECISION PRODUCT
- HIGH SPEED MULTIPLY
  - — 45 ns Max Clocked Multiply Time
- LOW POWER CMOS TECHNOLOGY
  - — 550 mW Max (active)
  - — 550 μW Max (CMOS Standby)
- SIMPLE INTERFACE
  - — Single 5V ± 10% Supply
  - — TTL Compatible Inputs and Outputs
- ONE REGISTER CLOCK — SEPARATE ENABLES
- TWO'S COMPLEMENT AND UNSIGNED MAGNITUDE MULTIPLICATION
- PIN COMPATIBLE, HIGH PERFORMANCE REPLACEMENT FOR AMD 29517 AND IDT 7217L
- AVAILABLE IN DIP OR LCC PACKAGES

DESCRIPTION

The LATTICE L1017 devices are high performance 16 × 16 bit double precision multipliers. Designed with high speed logic techniques and a modified Booth's algorithm, the devices feature 45 ns, 65 ns, and 90 ns clocked multiply times. These devices offer a performance upgrade and are pin compatible with industry standard multipliers like the AM29517A.

UltraMos™, LATTICE's high performance CMOS technology, provide the multipliers with an active power dissipation of 550 mW maximum and a low CMOS standby power consumption of 550 μW maximum.

The L1017 multipliers generate a 32-bit product from two 16-bit input busses. Internal registers feature separate enable controls with a single common clock. The input data on each port can be individually specified as unsigned magnitude or two's complement, by controlling the state of the C_X and C_Y mode lines. The most significant half of the product (MSP) is available on the 16-bit output port. The least significant half (LSP) is multiplexed with the MSP and can be accessed at the 16-bit output port and the Y operand input port.

ABSOLUTE MAXIMUM RATINGS(1)

SYMBOL	RATING	VALUE	UNIT
C_{TERM}	Terminal Voltage with Respect to GND(2)	−0.5 to +7.0	V
T_A	Operating Temperature	0 to +70	°C
T_{BIAS}	Temperature Under Bias	−55 to +125	°C
T_{STG}	Storage Temperature	−65 to +150	°C
P_T	Power Dissipation	1.0	W
I_{OUT}	DC Output Current	50	mA

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

RECOMMENDED DC OPERATING CONDITIONS ($T_A = 0°C$ to $+70°C$)

SYMBOL	PARAMETER	MIN	TYP	MAX	UNIT
V_{CCM}	Military Supply Voltage	4.5	5.0	5.5	V
V_{CCC}	Commercial Supply Voltage	4.5	5.0	5.5	V
GND	Supply Voltage	0	0	0	V
V_{IH}	Input High Voltage	2.0	—	—	V
V_{IL}	Input Low Voltage	—	—	0.8	V

DC ELECTRICAL CHARACTERISTICS

(Commercial: $V_{CC} = 5V \pm 10\%$, $T_A = 0°C$ to $70°C$; Military: $V_{CC} = 5V \pm 10\%$, $T_A = -55°C$ to $125°C$)

SYMBOL	PARAMETER	TEST CONDITIONS	COMMERCIAL MIN.	COMMERCIAL MAX.	MILITARY MIN.	MILITARY MAX.	UNIT
$\lvert I_{LI} \rvert$	Input Leakage Current	$V_{CC} = Max, V_{IN} = 0$ to V_{CC}	—	2	—	10	μA
$\lvert I_{LO} \rvert$	Output Leakage Current	High Z, $V_{CC} = max., V_{OUT} = 0$ to V_{CC}	—	2	—	10	μA
I_{CC}(1)	Operating Power Supply Current	Output Open	—	100	—	120	mA
I_{CCQ1}	Quiescent Power Supply Current	$V_{IN} \geq V_{IH}, V_{IN} \leq V_{IL}$	—	30	—	30	mA
I_{CCQ2}	Quiescent Power Supply Current	$V_{IN} \geq V_{CC} - .2V$ or $\leq .2V$	—	.1	—	.1	mA
V_{OH}	Output High Voltage	$V_{CC} = Min., I_{OH} = -0.4$ mA	2.4	—	2.4	—	V
V_{OL}	Output Low Voltage	$V_{CC} = Min., I_{OL} = 4.0$ mA	—	0.5	—	0.5	V

1. I_{CC} is measured at clock cycle = 10 mhz and V_{IN} = TTL voltages.

AC TEST CONDITIONS

Input Pulse Levels	GND to 3.0V
Input Rise and Fall Times	5 ns
Input Timing Reference Levels	1.5V
Output Reference Levels	1.5V
Output Load	See Figures 1 and 2

CAPACITANCE ($T_A = 25°C$, f = 1.0 MHZ)

SYMBOL	ITEM	CONDITIONS	MAX.	UNIT
C_{IN}	Input Capacitance	$V_{IN} = 0V$	10	pF
C_{OUT}	Output Capacitance	$V_{OUT} = 0V$	12	pF

NOTE: This parameter is sampled and not 100% tested.

LATTICE
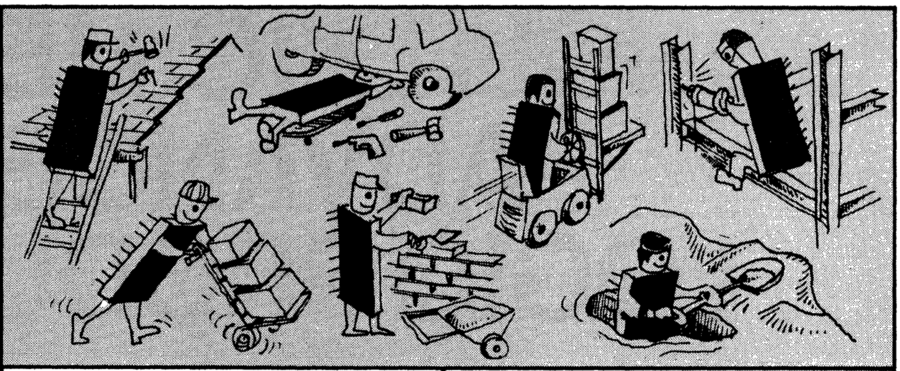
SEMICONDUCTOR CORP

MEET THE HARDEST WORKING CHIPS IN THE BUSINESS



PROGRAMMABLE INTEGRATED CONTROLLER/SEQUENCER

Microprocessor designed for applications requiring simple decision-making, not computation.

LS7270: Performs logical sequencing, timing, and controlling functions. Far more easily programmed than any other μP, and program can be stored in any standard ROM, PROM, EPROM, or RAM. Low-cost, reliable replacement for hard-wired controls and relay networks. 40-pin DIP.

DIGITAL LOCK CIRCUITS

For automotive/marine anti-theft.

LS7220: 5,040 4-digit combinations; out-of-sequence detection logic; 25μA standby; "Save" mode for valet parking settable in "Unlock"; built-in convenience delay. 14-pin DIP.

For area access and machine access.

LS7225-LS7226: 5,040 4-digit combinations; toggle output (set and reset with application of code); momentary output; tamper output. 14-pin DIP.

For serial address decoding or 2-pushbutton keyless locks.

LS7228-LS7229: Address decoder/digital lock; code programmable through 9 parallel pins; serial decoding input can be applied through dual pulse train or two pushbuttons; pulse output; duration between entries capacitor programmable; cascadable. 16-pin DIP.

BRUSHLESS DC MOTOR SPEED CONTROLLERS

LS7261/62: 3 or 4-phase commutator chips; overcurrent sensing; brake; reverse. 20-pin DIP.

LS7263: Crystal controlled 3-phase motor speed controller; for fixed speed applications; accuracy 0.1%. 18-pin DIP.

LS7264: Crystal controlled 4-phase motor speed controller; for fixed speed applications; accuracy 0.1%. 16-pin DIP.

PROGRAMMABLE DIGITAL DELAY TIMER

For delaying the starting or stopping of an operation.

LS7210: Can generate delays of ms to infinity, or add auto reset to μP system; programmed by 5 binary weighted input bits plus on chip oscillator or external clock. Operable in 4 modes: delayed operate or release, dual delay, or one-shot. All inputs CMOS, MOS, and TTL compatible. 14-pin DIP.

TOUCH SENSITIVE LAMP DIMMER/AC MOTOR SPEED CONTROLLER

Circuits digitally determine firing angle of a triac. Phase locked loop synchronization makes triac output "Pure AC", allowing triac to drive motor or transformer windings directly.

LS7231-35: Momentary touch turns triac off, if on; if off, momentary touch turns triac to maximum or to firing angle stored in MEMORY (depending on circuit). Prolonged touch causes firing angle to vary. 8 pin mini-DIP.

LS7237: A touch causes firing angle to advance to next state in sequence. Three state input pin ("1", "0", or "open") selects one of 3 modes of firing angle sequence: MAX/OFF; LOW/MED/MAX/OFF; MIN/LOW/MED/MAX/OFF. Pin compatible with LS7231-LS7235. 8 pin mini-DIP.

DISPLAY DRIVERS

For liquid crystal displays requiring up to 60V.

LS7100: BCD to 7 segment latch/decoder/driver.

LS7110: Binary addressable latched 8-channel demultiplexer/driver. Both are ion-implanted P Channel MOS circuits, compatible with CMOS and TTL systems. 16-pin DIPS.

CMOS DIVIDERS

For generating time bases from 50/60 Hz input. All feature: input shaping network; resettable; division select input 50/60 Hz; clock enable input; 8-pin mini-DIP.

RED 5/6: 10 pulses/sec.
RED 50/60: 1 pulse/sec.
RED 100/120: 1 pulse/2 seconds.
RED 300/360: 1 pulse/0.1 minute.
RED 500/600: 1 pulse/10 seconds.
RED 3000/3600: 1 pulse/minute.

For generating decade-related time bases.

RDD104: Addressable divider; divides by 10, 100, 1000, or 10,000. Input may be controlled by crystal or external frequency source. 8-pin mini-DIP.

LSI COMPUTER SYSTEMS INC.
Since 1969
Manufacturers of Custom and Standard LSI circuits.
1235 Walt Whitman Rd., Melville, NY 11747
(516) 271-0400. TWX: 510 226-7833.

COUNTERS

LS7066: 24-bit multimode counter. Programmable by microprocessor, via three-state I/O bus, to operate in the following modes: binary, BCD, 24 hour clock, up, down, ÷n, quadrature, and single cycle. Modes can co-exist in different combinations. DC to 5 MHz in all modes. Includes 24-bit comparator for pre-set count comparison; readable status register. Input/output TTL compatible. 20-pin plastic DIP.

LS7060: DC to 10 MHz 32-bit binary up counter with 32-bit latch and multiplexer; 8-bit three-state multiplexed outputs; input/output TTL compatible; bus compatible. 18-pin DIP.

LS7062: Identical except that it is a dual 16-bit counter, with two inputs.

LS7061: DC to 10 MHz 32-bit binary up counter with 40-bit latch and multiplexer; access to 8 LSB latches allows attachment of prescalers for counting to 2.56 GHz; 8-bit three-state multiplexed outputs; input/output TTL compatible; bus compatible. 24-pin DIP.

LS7063: Identical, except that it is a dual 16-bit counter, with two inputs.

LS7030: DC to 5 MHz eight decade up counter with 8-decade latch and multiplexer, multiplexed BCD and 7 segment outputs; inputs CMOS and TTL compatible; outputs CMOS compatible; counter output latches; leading zero blanking. 40-pin DIP.

LS7031: DC to 5 MHz six decade up counter with 8-decade latch and multiplexer, access to LSD latches allows attachment of prescalers for counting to 500 MHz; multiplexed BCD outputs; leading zero blanking; inputs CMOS and TTL compatible; outputs CMOS compatible. 40-pin DIP.

LS7055: DC to 250 KHz six decade up/down counter with integral preset, presignal, and main signal store; automatic or manual preset/reset control; 3 comparators with output flags; multiplexed BCD, 7 segment outputs and blanking override; internal oscillator; high noise immunity; all inputs CMOS compatible. 40-pin DIP.

LS7056: Identical, except that it has lamp test input instead of blanking override.

For our custom capabilities please see IC Master, CUSTOM SECTION, page 4675.

ECL10KH for High Performance System Design.

The designer of high-performance digital systems now has new alternatives with the introduction of Monolithic Memories' ECL 10KH family of Logic. Monolithic Memories' ECL 10KH devices are completely equivalent to Motorola's MECL 10KH. This means that the system designer can take advantage of the high performance of ECL 10KH logic, and eliminate the woe of having a sole-sourced logic family.

ECL logic is used in a broad range of applications that demand high speed and a stable system environment. ECL 10KH represents a particular optimization of semiconductor technology towards ease of use in systems. A summary of the advantages of ECL 10KH may be of use to the system designer.

ECL 10KH, in general, is compatible with 10K ECL logic, but it is faster, offers better noise margin, and operates at equal power as compared to MECL 10K logic. Propagation delays, and clock speeds are 100% better, and noise immunity is improved 75% over the MECL 10K series. The basic power dissipation of 25 mW/Gate is comparable to MECL 10K.

To obtain better circuit speeds, new semiconductor processing is used with ECL 10KH. Smaller transistors result from this processing, allowing greater speed. Other design changes are employed in ECL 10KH, over the basic MECL 10K gate structure, which yield better DC performance as well. ECL 10KH is a voltage-compensated logic family, allowing guaranteed DC and AC parameters over a ±5% power supply range. Voltage-compensation allows for smaller semiconductor die sizes for a given function as compared with ECL devices employing both voltage compensation and temperature compensation. Smaller die sizes translate into a lower production cost, which in turn means a lower cost to the end user.

FUNCTION	DEVICE
NOR Gate

The Logical Solution

Double-Density-PLUS™ Interface provides:

- 20% increase in speed
- Twice the storage capacity
- Twice the input/output ports
- Two or more 8-bit devices in one SKINNYDIP® package
- Two technologies: Bipolar and CMOS
- Cost advantages
- All this with half the original board space

Double-Density-PLUS Interface Typical Applications

'LS/ACT 793/4 Applications

- INSTRUMENTATION
- MICROPROCESSORS
- PERIPHERALS

Description

The 8-bit bus transceivers with 3-state ('LS646, 'LS648) or open-collector ('LS647, 'LS649) outputs have 16 D-type flip-flops and multiplexers. The bus-oriented pinout of the parts is shown in the Pin Configuration. The internal gate-level hardware configurations for the 'LS646/647 and 'LS648/649 are given in their respective Logic Diagrams. The basic repeated element, consisting of an edge-triggered flip-flop paralleled with a bypassing path or "feed-through" into a two-way mux, is sometimes called a "front-loading latch."

A pair of multiplexers are used to distribute two bytes of data through the part. The data-routing combinations offered by the multiplexers provide flexibility in directing data to or from either bus, and/or either register. Data is loaded into registers A or B upon the rising edge of the appropriate clock signals. CKA clocks register A, which receives data from the B bus directly at its inputs. Similarly, CKB clocks register B, which has the A bus available directly at its inputs. Control of the multiplexers is provided by two select lines (one per register), SRA and SRB. Command of the outputs is performed by enable line $\overline{E}$, and direction line DIR.

When $\overline{E}$ is High data from the buses can be stored into register A and B. When $\overline{E}$ is Low and DIR is High, the direction of operation is from A to B; when $\overline{E}$ and DIR are LOW, the direction of operation is from B to A.

SRA is used to select between register A and the B bus, and then to route the data to a controlled buffer connected to the A bus. Likewise, SRB selects between register B and the A bus, and then routes the data to the B bus through a controlled buffer.

8-Bit Bus Front-Loading-Latch Transceivers

SN54/74LS651
SN54/74LS653
SN54/74LS652
SN54/74LS654

Features/Benefits

- **Bidirectional bus transceivers and registers**
- **Independent registers for A and B buses**
- **Real-time data transfer or stored data transfer**
- **Simultaneous outputs on both buses**
- **24-pin SKINNYDIP® saves space**
- **8-bit data path matches byte boundaries**
- **Three-state or open-collector outputs drive bus lines**
- **'LS653/4 are open-collector in A direction, three-state in B direction**

Description

These 8-bit bus transceivers with 3-state ('LS651, 'LS652) or open-collector ('LS653, 'LS654) outputs have 16 D-type flip-flops and multiplexers. The bus-oriented pinout of the parts is shown in the Pin Configuration. The internal gate-level hardware configurations for the 'LS651/653 and 'LS652/654 are given in their respective Logic Diagrams. The basic repeated element, consisting of an edge-triggered flip-flop paralleled with a bypassing path or "feed-through" into a two-way mux, is sometimes called a "front-loading latch."

A pair of multiplexers are used to distribute two bytes of data through the part. The data-routing combinations offered by the multiplexers provide flexibility in directing data to or from either bus, and/or either register. Data is loaded into registers A or B upon the rising edge of the appropriate clock signals. CKA clocks register A, which receives data from the B bus directly at its inputs. Similarly, CKB clocks register B, which has the A bus available directly at its inputs. Control of the multiplexers is provided by two select lines (one per register), SRA and SRB. Command of the outputs is performed by two enable lines, GAB and $\overline{\text{GBA}}$.

When GAB is Low and $\overline{\text{GBA}}$ is High, data from the buses can be loaded into registers A and B. When $\overline{\text{GBA}}$ is Low, the A bus is configured for output. When GAB is High, the B bus is configured for output. The A and B buses can be enabled at the same time, to operate as outputs simultaneously.

SRA is used to select between register A and the B bus, and then to route the data to a controlled buffer connected to the A bus. Likewise, SRB selects between register B and the A bus, and then routes the data to the B bus through a controlled buffer.

8-Bit Two-Stage Pipelined Register/Latch

SN54/74LS548 SN54/74LS549

Feature/Benefits

- **Two 8-bit high-speed registers/latches**
- **Faster than other LS-TTL registers/latches**
- **Three-state outputs drive bus lines**
- **24-pin SKINNYDIP® saves space**
- **8-bit data path matches byte boundaries**
- **Multiplexer selects either rank at input/output**
- **Output can drive bus directly: I_{OL} 32 mA (com), 24 mA (mil)**
- **Registers/latches configurable for nose-to-tail or side-by-side operation**
- **Individual clock/gate enables for each rank**

Applications

- **Registers for pipelined arithmetic units or digital signal processors**
- **Bus monitor for popular 8-bit microprocessors to restart instructions upon virtual memory page fault**
- **Video display character/attribute pipelined registers**
- **Sequence/state generator for systems: dual-rank registers/latches allow storing a backup previous state for redundancy, or diagnostics**
- **Two-stage buffer for pipelined interfacing input/output**

Description

The 54/74LS548 and 54/74LS549 contain a pair of high-speed 8-bit registers ('LS548) or latches ('LS549) which perform various pipeline storage functions. Two control pins govern a pair of internal multiplexers, as shown in the block diagrams; using these, several useful data paths can be configured. The input selection multiplexer determines the source of data to the second register/latch, as controlled by the INSEL line. In this way, data from either the D7-D0 inputs, or the outputs of the first register/latch, are stored in the second register/latch. The output selection multiplexer determines the source of data that will be sent to the outputs Y7-Y0. This multiplexer is controlled by the OUTSEL line, and allows either the first or second register/latch data to be output. The outputs are fully buffered, provide high-drive current, and allow three-state control through the $\overline{OE}$ line.

The arrangement of registers/latches within the 'LS548/'LS549 can be thought of a two 8-bit storage ranks, rank 1 and rank 2. The 'LS548 has a common clock line CK, and separate clock enables $\overline{CKE1}$ and $\overline{CKE2}$ for rank 1 and rank 2 respectively. In contrast, the 'LS549 operates as a flow-through latch, and has separate latch enables $\overline{G1}$ and $\overline{G2}$ for each rank, as well as a common latch-enable input G.

Ordering Information

PART NUMBER	PKG	TEMP	TYPE	POWER
SN54LS548	JS,F,L	Mil	Register	LS
SN74LS548	NS,JS	Com		
SN54LS549	JS,F,L	Mil	Latch	
SN74LS549	NS,JS	Com		

* NOTE: L package here is L28. The other packages are 24-pin.

In the 'LS548, data present at the D7-D0 inputs are stored in rank 1 on the positive edge of CK, if $\overline{CKE1}$ has been previously asserted. Data for rank 2 are stored similarly, if $\overline{CKE2}$ is asserted prior to the clock. In the 'LS549, data pass through the latches when the latch controls ($\overline{G1}$ or $\overline{G2}$) for either rank are enabled simultaneously with the common latch enable G. Data remain in a rank when the latch controls are disabled, or 'unasserted'.

The clock/gate control lines are used with the INSEL and OUTSEL controls for flexible data storage and movement operations. Two representative examples are shown in Figure 1 (a) and 1 (b). The first example is a classical 2-stage pipelined register, or 'nose-to-tail' configuration. Data at D7-D0 are first stored in rank 1, then stored in rank 2 on the next clock/gate. If the clock/gate enable for either rank becomes unasserted, then the previously-stored data are simply retained. In the second example, data at D7-D0 are stored in either or both ranks if the respective clock/gate enable signals are asserted. In this 'side-by-side' configuration, data sent to the Y7-Y0 outputs are selected from either rank 1 or rank 2, under control of the OUTSEL line.

8-Bit Latch/Register with Readback

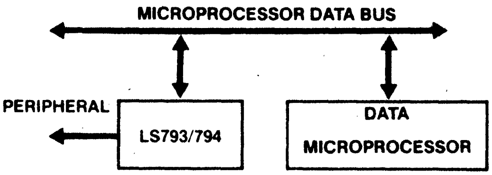
SN54/74LS793 SN54/74LS794

Features/Benefits

- **I/O port configuration enables output data back onto input bus**
- **20-pin SKINNYDIP® saves space**
- **8-bit data path matches byte boundaries**
- **Ideal for microprocessor interface**

Description

These 8-bit latches/registers are useful for I/O operations on a microprocessor bus. An image of the output data can be read back by the CPU. This operation is important in control algorithms which make decisions based on the previous status of output controls. Rather than storing a redundant copy of the output data in memory, simply reading the register as an I/O port allows the data to be retrieved from where it has been stored in an 'LS793/4, for verification and/or updating.



MICROPROCESSOR DATA BUS
PERIPHERAL
LS793/794
DATA
MICROPROCESSOR

The data is loaded in the registers on the low-to-high transition of the clock (CK), for the 'LS794. The data is passed through the 'LS793 when the gate, (G), is High, and it is "latched" when G changes to Low. The output enable, $\overline{OE}$ is used to enable data on D7-D0. When $\overline{OE}$ is low the output of the latches/registers is enabled on D0-D7, enabling D as an output bus so that the host can perform a read operation. When $\overline{OE}$ is High, D7-D0 are inputs to the latches/registers configuring D as an input bus.

The output drive of these commercial parts for any output pin is I_{OL} = 24 mA. They are available in the popular 20-pin SKINNYDIP® package.

'LS793 Function Table

G	$\overline{OE}$	Q	D
L	L	Q_0**	Output, Q
L	H	Q_0**	Input
H†	L	D*	Output, Q*
H	H	D	Input

* In this case the output of the latch feeds the input, and a "race" condition results.

** Q_0 represents the previous "latched" state.

† This transition is not a normal mode of operation and may produce hazards.

Asynchronous First-In First-Out Memory (FIFO) 16x5
74S225/A

Features/Benefits

- DC to 20-MHz shift-in/shift-out rates
- Fully expandable by word width and depth
- Three-state outputs
- TTL-compatible inputs and outputs
- Functionally compatible with T.I. SN74S225
- Designed for extended testability

Description

The 74S225/A is a Schottky-clamped transistor-transistor logic (STTL) 16x5 First-In-First-Out memory (FIFO) which operates from DC to 10/20 MHz. The data is loaded and emptied on a first-in-first-out basis through asynchronous input and output ports. These devices are used in digital systems performing data transfers when source and receiver are not operating at the same data rate. FIFOs are also used as data buffers where the source and receiver are not operating at the same time. Both word length and FIFO depth are expandable. Unload clock output (Pin 3) is designed for testability of V_{OL}.

- Choice of 4-bit or 5-bit data width
- TTL inputs and outputs
- Readily expandable in the word and bit dimensions
- Structured pinouts. Output pins directly opposite corresponding input pins
- Asynchronous operation
- Pin-compatible with Fairchild's F3341 MOS FIFO and many times faster

Description

The C5/C67401B/2B/1A/2A/1/2 are "fall-through" high speed First-In First-Out (FIFO) memory organized 64 words by 4 bits and 64 words by 5 bits respectively. A 16.7 MHz data rate allows usage in digital video systems; a 15 MHz data rate allows usage in high speed tape or disc controllers and communications buffer applications. Both word length and FIFO depth are expandable.

Monolithic Memories

First-In First-Out (FIFO) 64x5 Memory 35 MHz (Standalone)

57413A 67413A 67413

Features/Benefits

- High-speed 35 MHz shift-in/shift-out rates
- High-drive capability
- Three-state outputs
- Half-full and Almost-full/Empty status flags
- Structured pinouts. Output pins directly opposite corresponding input pins.
- Asynchronous operation
- TTL-compatible inputs and outputs

Description

The 5/67413A, 67413 are high-speed, 64x5 First-In-First-Out memories (FIFOs) which operate at 35-MHz input/output rates (67413 operates at 25-MHz in-out). The data is loaded and emptied on a first-in-first-out basis. It is a three-state device with high-drive (I_{OL} = 24 mA) data outputs. These devices can be connected in parallel to give FIFOs of any word length. It has a Half-full flag (thirty-two or more words full) and an almost full/empty flag (fifty-six or more words or eight or less words). The main applications of 5/67413A, 67413 are rate buffers; sourcing and absorbing data at different rates. Other applications are high-speed tape and disk controllers, data communications systems and plotter control systems.

Monolithic Memories

Serializing First-In-First-Out (FIFO) 64x8/9 Memory

67417

Features/Benefits

- **High-speed 28-MHz serial shift-in/shift-out rate**
- **10-MHz parallel shift-in/shift-out rate**
- **Three-state outputs with Hi-current drive**
- **Cascadable at parallel port only**
- **Half-full flag (32 or more)**
- **Selectable 64x8 or 64x9 FIFO configuration thus providing "frame mark bit"**

Typical Applications

- **LAN equipment**
- **Data communication**
- **Office automation**
- **Microcomputers**
- **Minicomputers**
- **Disk/tape controllers**

Description

The 67417 is a serializing/deserializing FIFO. This FIFO, the first one of its type in the industry, is organized 64 words x 8/9 bits wide. Like traditional Monolithic Memories' FIFOs it is cascadable, but only at the parallel port.

Ordering Information

PART NUMBER	PACKAGE	TEMPERATURE	DESCRIPTION
67417	J	Com	64x9

In addition, the device has the ability to connect directly to a system bus. These features make it a complete "sub-system on a chip."

The FIFO basically has three modes of operation;

1. Serial in to parallel out
2. Parallel in to serial out
3. Serial in to serial out (requires non-standard logic level on PDIR).

In the first mode, serial data can be accepted at up to 28 MHz and the FIFO outputs parallel data at up to 10 MHz. Similarly, in the alternate mode parallel data can be transformed into serial data. Please refer to appendix for detailed description.

Monolithic Memories

FIFO RAM Controller
674219

Features/Benefits

- **High-speed, no fall-through time**
- **Deep FIFOs — 16-bit SRAM address**
- **Arbitration read/write**
- **Control signals for data latching**
- **Full, Half-Full, Empty, Almost flags for any buffer size from 512 to 64K**
- **Three-state outputs**

Applications

- **LAN equipment**
- **Data communication**
- **Disk/tape controllers**
- **Host-to-dedicated-processor interface**

Description

The 674219 FIFO RAM Controller provides addressing control, status, and arbitration for a static RAM array used as a First-In-First-Out (FIFO) buffer. The sixteen address lines can address a FIFO buffer area ranging from 512 to 65,536 static RAM words. Control signals include $\overline{W}$ (the write enable signal for the static RAMs), handshaking signals for the read and write ports, and strobes for external data latching.

16x16 Flow-Thru™ Multiplier Slice 54/74S556

Features/Benefits

- **Twos-complement, unsigned, or mixed operands**
- **Full 32-bit product immediately available on each cycle**
- **High-speed 16x16 parallel multiplier**
- **Latched or transparent inputs/outputs**
- **Three-state output controls, independent for each half of the product**
- **Single +5 V supply (via multiple pins)**
- **Available in 84-terminal Leadless-Chip Carrier and 88-Pin-Grid-Array packages**

Description

The 'S556 is a high-speed 16x16 combinatorial multiplier which can multiply two 16-bit unsigned or signed twos-complement numbers on every cycle. Each operand X and Y has an associated mode-control line, XM and YM respectively. When a mode-control line is at a LOW logic level, the operand is treated as an unsigned 16-bit number; when the mode-control line is at a HIGH logic level, the operand is treated as a 16-bit signed twos-complement number. Additional inputs RS and RU allow the addition of a bit into the multiplier array at the appropriate bit positions for rounding. The entire 32-bit double-length product is available at the outputs at one time.

Ordering Information

PART NUMBER	PACKAGE	TEMPERATURE
54S556	P88, L84*	Military
74S556	P88, L84*	Commercial

P88 is an 88-Pin-Grid-Array Package.

L84 is an 84-terminal Leadless-Chip Carrier Package.

* The 84-terminal leadless chip carrier, L84, and its socket, L84-2, are in development; contact the factory for further details.

The most-significant product bit, S31, is available in both true and complemented form to simplify longer-wordlength multiplications. The product outputs are three-state, controlled by assertive-low enables. The MSP outputs are controlled by the TRIM ($\overline{OEM}$) control input, while the LSP outputs are controlled by the TRIL ($\overline{OEL}$) control input. This allows one or more multipliers to be connected to a parallel bus or to be used in a pipelined system.

All inputs and outputs have transparent latches. The latches become transparent when the input to the corresponding gate control line GX, GY, GM, GL is HIGH. If latches are not required, these control inputs may be tied HIGH, leaving the multiplier fully transparent for combinatorial cascading. The device uses a single +5 V power supply, and is available both in an 84-terminal leadless chip carrier (LCC) package and in an 88-pin-grid-array package.

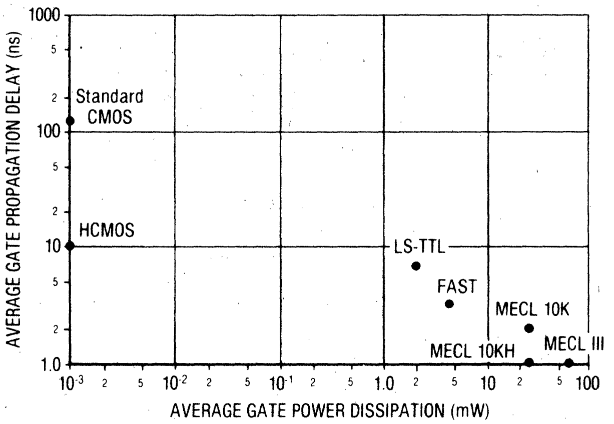
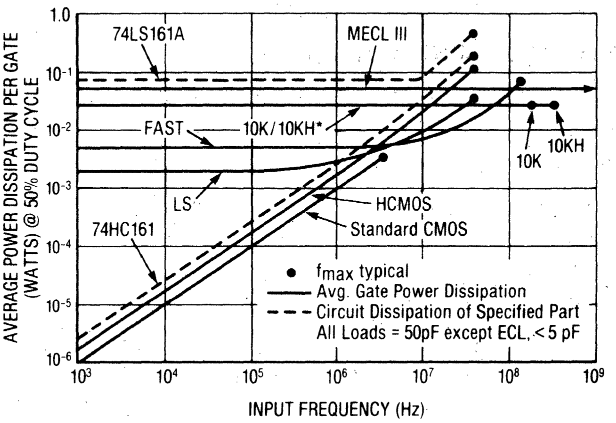


Graph 1 — General Comparison of Speed/ Power Characteristics



Graph 2 — Variations In Power Dissipation as a Function of Operating Frequency

The variety of established and newly introduced logic families challenges the system designer with choosing the best available technology for each design. Each family offers distinct advantages and limitations.

The three most often used characteristics for determining family selection are propagation delay, operating frequency, and power consumption. For Motorola logic families, these characteristics are displayed and compared in the graphs above. Graph 1 illustrates the tradeoffs between power dissipation and propagation delay at low operating frequencies. As frequency increases, the changes in power dissipation characteristics of the various families vary considerably, graph 2. These factors, plus the ever-changing impact of economics, must be considered in the selection of the most suitable logic line.

INTRA-FAMILY RELATIONSHIPS

Schottky TTL

For many years, Transistor-Transistor Logic (TTL), specifically the 54/74 TTL series, has been the dominant logic family for general-purpose applications. Within the last few years, low-power Schottky (LSTTL) has taken over, replacing the original 7400 series with lower power and higher speed. The latest in this progressive logic series are the Advanced Low-Power Schottky (ALSTTL) family and the FAST™ Schottky TTL series.

The **Low Power Schottky (LSTTL)** family combines a current and power reduction improvement over standard 7400 TTL by a factor of 5. This is accomplished by advanced processing and by using Schottky diode clamping to prevent saturation.

The **FAST Schottky TTL** family provides a 75–80% power reduction compared to standard Schottky (54/74S) TTL and yet offers a 20–40% improvement in circuit performance over the standard Schottky due to the MOSAIC process. Also, FAST circuits contain additional circuitry to provide a flatter power/frequency curve. The input configuration of FAST uses a lower input current which translates into higher fanout.

Speed/Power comparisons between these three families are as follows:

SPEED/POWER CHARACTERISTICS FOR SCHOTTKY TTL LOGIC

(ALL TYPICAL RATINGS)

Characteristic	**Symbol**	**LS**	**FAST**	**Units**
Quiescent Supply Current/Gate	I_G	0.4	1.1	mA
Power/Gate (Quiescent)	P_G	2.0	5.5	mW
Propagation Delay	t_p	9.0	3.7	ns
Speed Power Product	—	18	19.2	pJ
Clock Frequency (D-F/F)	f_{max}	33	125	MHz
Clock Frequency (Counter)	f_{max}	40	125	MHz

MECL (ECL)

Motorola's Emitter Coupled Logic (MECL) is a nonsaturating form of digital logic which eliminates transistor storage time as a speed limiting characteristic, permitting very high speed operation.

Motorola offers three versions of MECL: MECL 10K, MECL 10KH, and MECL III.

The *MECL 10K* series has become the industry standard for high-speed applications. In order to make the circuits comparatively easy to use, edge speed was slowed to 2.0 ns while the important propagation delay was held to 2.0 ns. The slow edge speed permits use of wire-wrap and standard printed circuit lines; however, the circuits are specified to drive transmission lines for optimum performance.

The newer *MECL 10KH* family features 100% improvement in propagation delay and clock speeds while maintaining power supply current equal to MECL 10K. This new MECL family is voltage compensated which allows guaranteed dc and switching parameters over a ±5% power supply range. Noise margins of MECL 10KH are 75% better than the MECL 10K series. MECL 10KH is compatible with MECL 10K and MECL III, a key element in allowing users to enhance existing systems by increasing the speed in critical timing areas.

MECL III, with its 1 ns gate propagation delays and greater than 1 GHz flip-flop toggle rates, remains the industry speed leader. The 1 ns rise and fall times require a transmission line environment for all but the smallest systems. For this reason, all circuit outputs are designed to drive transmission lines and all output logic levels are specified when driving 50-ohm loads. Because of MECL III's fast edge speeds, multi-layer boards are recommended above 200 MHz. MECL III's popularity is with high-speed test and communications equipment.

Speed/power comparisons for Motorola ECL families are as follows:

SPEED/POWER CHARACTERISTICS FOR (MECL)

(ALL TYPICAL RATINGS)

		MECL 10K				10KH	III	
Characteristic	**Symbol**	**MC101xx**	**MC102xx**	**MC105xx**	**MC106xx**	**MC10H1xx**	**MC16xx**	**Units**
Quiescent Supply Current/Gate	I_G	5.0	5.0	5.0	5.0	5.0	10	mA
Power/Gate (Quiescent)	P_G	26	26	26	26	26	54	mW
Propagation Delay	t_p	2.0	1.5	2.0	1.5	1.0	1.1	ns
Speed Power Product	—	52	39	52	39	26	59	pJ
Clock Frequency (D-F/F)	f_{max}	150	225	150	225	300	550	MHz
Clock Frequency (Counter)	f_{max}	150	—	150	—	300	1200	MHz

CMOS

Complementary MOS (CMOS) technology provides the lowest power consumption logic circuits available in the industry. The term "complementary" refers to the basic circuit building unit, where a pair of N and P-channel insulated gate FET's are cascoded. This configuration results in extremely low quiescent current, drawing power only when being switched.

Motorola offers two versions of CMOS logic circuits: *Standard CMOS* in metal gate technology, and *High-Speed CMOS* in silicon gate technology.

Standard CMOS logic is best suited for systems which require low power and low-to-medium speed (1 MHz) operation. Some devices are available in both B and UB series, as designated by EIA/JEDEC specifications. UB series gates and inverters are constructed with a single inverting stage between input and output, as opposed to multiple gain stages in the B series. The subsequent decreased gain in the UB series results in less noise immunity; however, these UB devices are useful when CMOS gates and inverters are used in a "Linear" mode to form oscillators, monostables, or amplifiers. These devices also exhibit higher speed since only a single stage is involved.

The new High-Speed CMOS family consists of a full-line of products that are pinout compatible with the most popular LSTTL and MC14000B Standard CMOS series parts. Use of the latest silicon-gate processing technology allows the High-Speed CMOS family to combine the switching speeds and operating frequencies of LSTTL with the low power-consumption advantages of CMOS. The standard logic devices in the family will drive ten LSTTL loads. The bus-compatible devices will drive fifteen LSTTL loads. The devices feature CMOS input levels, the high noise immunity that is characteristic of CMOS, and a wide power-supply operating range (2 to 6 volts).

High-Speed CMOS logic circuits may interface with LSTTL circuits directly when driving, and through a level shifter when being driven. The latter is due to the selection of slightly different threshold voltages for the High-Speed CMOS than those of LSTTL to provide higher DC Noise Margins.

Speed/power comparisons between the two CMOS families are as follows:

(ALL TYPICAL RATINGS)

SPEED/POWER CHARACTERISTICS FOR CMOS LOGIC

Characteristic	**Symbol**	**Standard CMOS**	**Hi-Speed CMOS**	**Units**
Quiescent Supply Current/Gate	I_G	.0001	.0003	mA
Power/Gate (Quiescent)	P_G	.0006	.001	mW
Propagation Delay	t_p	125	8.0	ns
Speed Power Product	—	.075	.01	pJ
Clock Frequency (D-F/F)	f_{max}	4.0	40	MHz
Clock Frequency (Counter)	f_{max}	5.0	40	MHz

Functionally Comparable Logic Integrated Circuits

The following table offers a quick guide to logic circuits in the various families available from Motorola. Devices perform comparable functions within a specific logic family. Pinout configurations are generally identical when the numbers in the columns correspond, although there may be exceptions. Consult the data sheets for specific details.

The numbers in the various columns are suffixes that follow the basic line prefixes associated with each specific product line. These basic prefixes are as follows:

PREFIXES:	**LS: SN54/74LS**	**Standard CMOS: MC14**	**MECL10K: MC10**
	FAST: MC54/74F	**Hi-Speed CMOS: MC54/74HC**	**MECL10KH: MC10H**
			MECL III: MC

Thus, the TTL LS Quad 2-input gate (item 1 in the table) can be ordered under the part number SN54LS06 (or SN74LS06). Similarly, the MECL10KH 2-input gate bears the part number MC10KH104.

NCR

NCR45CG72
Geometric Arithmetic Parallel Processor

Features

- **CMOS systolic array with 72 processors per chip**
- **12 x 6 array of bit serial processing elements**
- **Single instruction multiple data stream architecture—all processing elements operate in parallel**
- **GAPP devices are fully cascadeable**
- **System throughput increases linearly with number of processor elements in the system**
- **Broadcast global input and output**
- **Separate I/O bus = overlapped I/O and computation**
- **128 Bits of static RAM per processor**
- **VLSI double layer metal CMOS technology**
- **500 milliwatts power at 10 MHz**

Applications

Pattern Recognition

- Correlation
- Sobel Transform
- Spoke Filter
- Template Matching
- Automated Inspection
- Machine Vision

Parallel Data Processing

- Convolution
- Matrix Operations
- Histogram
- Search and Sort

Image Processing

- Image Enhancement
- Edge Detection
- 2-Dimensional Convolution
- Compression
- Spatial Filtering
- Differential Imaging

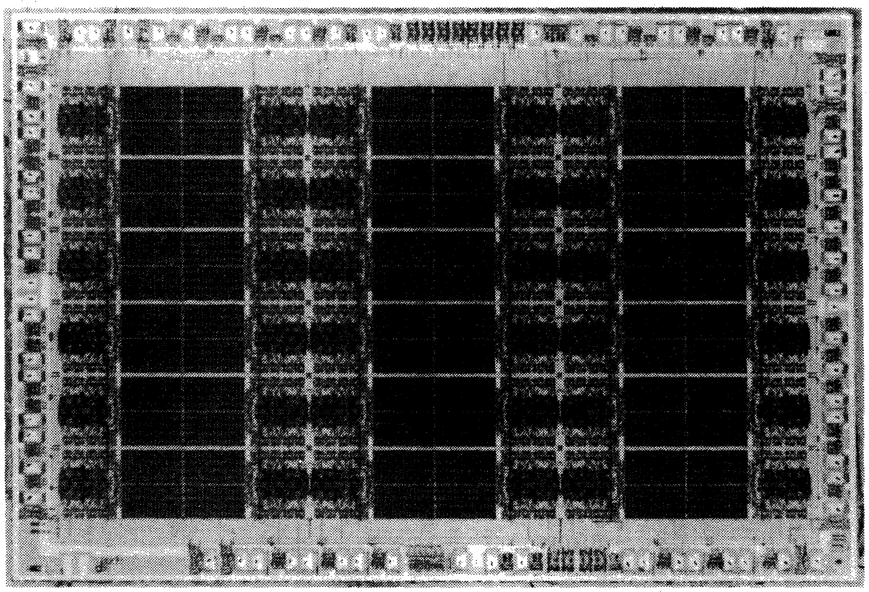
Associative Processor

- Content Addressable Memory
- Limit Search
- Hamming Distance

Functional Description

Announced in 1984, the Geometric Arithmetic Parallel Processor, or GAPP™ chip is the first commercially available systolic array parallel processing integrated circuit. For its efforts, NCR was awarded the Industrial Research award by Research and Development Magazine. The GAPP chip is a general purpose processor that can be used in a wide variety of applications such as: Pattern Recognition, Automated Inspection, Machine Vision, Image Processing, Parallel Data Processing, and Associative Processing. On each chip are 72 processing elements arrayed in a 12 x 6 configuration. The 72 processing elements each operate concurrently, executing the same instructions at the same time. If we contrast this with the traditional Von Neumann architecture that is commonly used in computers today (in which a single processing element processes a single data item at a time), by comparison, a single GAPP chip processes 72 times as many data items at a time. For this reason, the architecture of the GAPP chip is referred to as Single Instruction Multiple Data (SIMD) as opposed to the Von Neumann architecture which is referred to as Single Instruction Single Data, or SISD.

In addition, each processing element on the chip can communicate with its immediate neighbor processing elements in the 12 x 6 array, a very desirable characteristic in many parallel processing applications. In effect, each processing element is only aware of processing elements in its local neighborhood. This property allows designers the ability to directly cascade GAPP chips to form arbitrarily large arrays of processing elements. For instance, 2 GAPP chips can be connected to form a 12 x 12 array, or 24 x 6 array of processing elements. Regardless of the configuration, with 2 GAPP chips you have the processing power of 144 processing elements all operating in parallel.



NCR45CG72—GEOMETRIC ARITHMETIC PARALLEL PROCESSOR CHIP

NCR45CG72
Geometric Arithmetic Parallel Processor

The architecture of the GAPP chip makes it ideal for many neighborhood operations frequently encountered in image processing applications. These include convolution, correlation, and edge detection just to name a few. For example, a single GAPP chip can perform a 3 x 3 convolution on 8-bit data at a processing rate of 400,000 pixels per second. Edge detection over a 3 x 3 neighborhood using the Sobel gradient operator can be done at a processing rate of 688,000 pixels per second using a single GAPP device. As devices are cascaded to form larger arrays of processing elements the performance of a GAPP based system provides unmatched processing power.

Performance of GAPP Systems

Calculation	Execution Time (Per Image Plane with 10 MHz Clock)	Pixels per Second Processed		
		6 X 12 Array (1 GAPP)	48 X 48 Array (32 GAPPS)	192 X 192 Array (512 GAPPS)
1. 8-Bit Add	2.5 μS	28.8 M	921 M	14.7 B
2. 8-Bit Multiply	27.1 μS	2.6 M	124 M	1.3 B
3. 8-Bit 3 X 3 Gauss Filter*	71.7 μS	557 K	30 M	503 M
4. 8-Bit 3 X 3 Convolution*	100 μS (Typical)	400 K	22 M	361 M
5. 8-Bit 5 X 5 Convolution*	273 μS (Typical)	58 K	7 M	129 M
6. Binary 21 X 21 Correlation*	1.1 mS	—	712 K**	27 M
7. Edge Detection (Sobel Gradient)	58.1 μS	688 K	36 M	621 M

*Efficiency improved if edge buffers used.
**2M if edge buffers are used.

Development Support

The GAPP chip is supported by software development tools that greatly enhance the ability of programmers to develop GAPP software. These two products are the NCR45GDS1, the GAPP PC Development System, and the NCR45GS2, the GAPP Simulator/Assembler.

The GAPP PC Development System consists of a board which plugs into an IBM PC or PC compatible computer, and user interface software. The PC Development System is targeted for programmers who wish to develop GAPP software in a personal computer environment. The board contains two GAPP devices configured to form a 12 x 12 array of parallel processing elements. Programs written by the programmer are downloaded from the PC to the board and executed on GAPP hardware.

Programs are written in the GAPP Algorithm Language (GAL™), a high-level programming language that allows GAPP instructions to be imbedded in C programming language control statements. The program debugger allows users to: single step through a GAPP program, execute to a user specified breakpoint, or execute an entire program. In addition, programmers are able to examine the internal state of each processing element in the array as programs are being debugged.

The Simulator/Assembler supports programmers who develop GAPP software in a VAX environment. The Simulator allows programmers to simulate in software the execution of GAPP programs.

Programs for the Simulator use GAPP mnemonic instructions. Within the Simulator, programmers can execute single instructions, or a sequence of instructions. While executing files that contain a sequence of GAPP instructions, programmers can specify breakpoints wherever there is a need to suspend program execution to examine the internal state of the processing element array.

With these two development tools: the 45GDS1, and 45GS2, NCR supports GAPP software development for the most popular development system environments.

For Further Information

What does this all mean? It means that NCR offers the processing power to solve your most difficult applications with support tools that allow you to utilize the power of parallel processing in your systems.

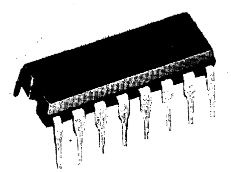
Panasonic Industrial Co.

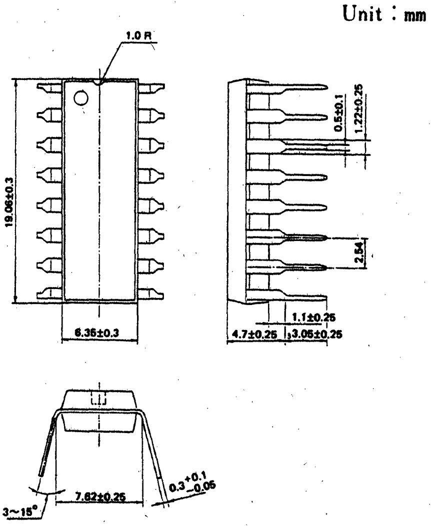
MN41256 262,144-word × 1-bit NMOS Dynamic RAM

Descriptions

The MN41256 is a 263,144-word by 1-bit Dynamic Random Access Memory in a 16 lead 300 mil. dual-in-line Plastic Package. The design is optimised for high-speed, high-performance applications such as mainframe memory, buffer memory and environments where low power dissipation and compact layout is required.

Clock timing requirements are non-critical, and power supply tolerance is very wide.





16-Lead Dual-In-Line Plastic Package

Features

- 262,144-word x 1-bit
- High Speed and Low power

Family / Parameter	MN41256-12	MN41256-15
Max. Access Time	120 ns	150 ns
Min. Cycle Time	220 ns	260 ns
Max. Standby Power	27.5 mW	27.5 mW
Max. Active Power	457 mW	385 mW

- Single 5V, ±10% tolerance
- Common I/O Capability using Early Write operation
- Page Mode, Read-Modify-Write capability
- $\overline{\text{RAS}}$-Only-Refresh, Hidden Refresh capability
- TTL compatible inputs/outpus
- 256 refresh cycle/4 ms
- Standard 16-Pin DIP
- t_{CAC}: t_{RCD} = 1 : 1

The device specifications are subject to change without prior notice. While every precaution has been taken in the preparation of this data sheet, the publisher assumes no responsibility for patent liability with respect to the use of the information contained herein.

Data-In hold time	t_{DH}	ns	25	–	30	–	9)
$\overline{\text{CAS}}$ to $\overline{\text{WRITE}}$ delay	t_{CWD}	ns	50	–	60	–	10)
$\overline{\text{RAS}}$ to $\overline{\text{WRITE}}$ delay	t_{RWD}	ns	110	–	135	–	10)
Read command hold time referenced to $\overline{\text{RAS}}$	t_{RRH}	ns	20	–	20	–	

Note:

1) Several cycles are required after power up or prolonged periods of $\overline{RAS}$ inactivity (4 ms) before proper device operation is achieved. Any 8 cycles which perform refresh are adequate for this purpose.
2) AC measurements assume t_T = 5.0 ns.
3) V_{IH} and V_{IL} are reference levels for measuring signal timings and transition times.
4) Assumes that $t_{RCD} \leqq t_{RCD}$ (Max).
5) Assumes that $t_{RCD} \geqq t_{RCD}$ (Max).
6) Measure with load equivalent to 2 TTL loads and 100pF.
7) t_{OFF} defines the time at which the output enters high impedance state. It is not referenced to levels of V_{IH} and V_{IL}.
8) Operation within the t_{RCD} (Max) limit ensures that t_{RAC} (Max) can be met. t_{RCD} is specified as a reference point only; if t_{RCD} is greater than the specifed t_{RCD} limit, then row access time is $t_{RCD} + t_{CAC}$.
9) These parameters are referenced to leading edge of $\overline{CAS}$ (Early-Write) or $\overline{WRITE}$ (Delayed-Write or Read-Modify-Write) whichever occurs last.
10) t_{WCS}, t_{CWD} and t_{RWD} are not restrictive operating parameters. They are included under AC Characteristics as electrical characteristics only. If $t_{WCS} \geqq t_{WCS}$ (Min), the cycle is an Early-Write cycle and the data out pins will remain open circuit (high impedance) throughout the entire cycle. If $t_{CWD} \geqq t_{CWD}$ (Min) and $t_{RWD} \geqq t_{RWD}$ (Min), the cycle is a Read-Modify-Write cycle and the data out will contain data read from the selected cell. If neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.

CMOS Digital Logic Integrated Circuits

The RCA CMOS product line covers a broad range of SSI, MSI, and LSI functions from simple gates to complex counters, registers, and arithmetic circuits, and includes both standard circuit types for commercial and industrial applications and high-reliability slash (/) series types for aerospace, military, and critical industrial applications.

Following its tradition of leadership in CMOS, RCA offers a comprehensive line of high-voltage ("B"-series) CMOS digital integrated circuits which meet, in all respects, the industry standard specifications established by JEDEC.

12-stage	CD4040B	16
	CD4040A	16
14-stage	CD4020B	16
	CD4020A	16
14-stage counter/divider and oscillator	CD4060B	16
	CD4060A	16
Timers		
21-stage	CD4045B	14
Programmable	CD4536B	16
	CD4541B	14
Synchronous		
Decade counter/divider plus 10 decoded decimal outputs	CD4017B	16
	CD4017A	16
Divide-by-8 counter/divider with 8 decimal outputs	CD4022B	16
	CD4022A	16
Presettable divide-by-"N" counter, fixed or programmable	CD4018B	16
	CD4018A	16
Programmable-divide-by-"N" counter	CD4059A	24
Presettable up/down counter, binary or BCD-decade	CD4029B	16
	CD4029A	16
Presettable 4-bit BCD up/down counter	CD4510B	16
Presettable 4-bit binary up/down counter	CD4516B	16
Presettable 2-decade BCD down counter	CD40102B	16
Presettable 8-bit binary down counter	CD40103B	16
Presettable 4-bit BCD up/down counter	CD40192B	16
Presettable 4-bit binary up/down counter	CD40193B	16
Dual BCD up counter	CD4518B	16
Dual binary up counter	CD4520B	16
Decade counter/asynchronous clear	CD40160B	16
Binary counter/asynchronous clear	CD40161B	16
Decade counter/synchronous clear	CD40162B	16
Binary counter/synchronous clear	CD40163B	16
Display Drivers		
With Counter		
Decade counter/divider with 7-segment display outputs and display enable	CD4026B	16
Decade counter/divider with 7-segment display outputs and ripple blanking	CD4033B	16
Up/Down Counter-Latch-Decoder-Driver	CD40110B	16

CMOS Function Selection Chart

Function	Type No.	No. of Pins
Display Drivers (cont'd)		
For Liquid-Crystal-Display Drive		
4-segment display driver	**CD4054B**	16
BCD-to-7-segment decoder/driver with "display-frequency" output	**CD4055B**	16
BCD-to-7-segment decoder/driver with strobed-latch function	**CD4056B**	16
	CD4543B	16
4-digit decoder/driver with hexidecimal display	**CD22104**∇	40
4-digit decoder/driver with decimal display	**CD22104A** ∇	40
4-digit decoder/driver with hexidecimal display	**CD22105** ∇	40
4-digit decoder/driver with decimal display	**CD22105A** ∇	40
For Light-Emitting-Diode Drive		
BCD-to-7-segment latch decoder/driver	**CD4511B**	16
Multiplexers/Demultiplexers		
Analog		
Triple 2-channel	**CD4053B**	16
Differential 4-channel	**CD4052B**	16
Single 8-channel	**CD4051B**	16
Differential 8-channel	**CD4097B**	24
Single 16-channel	**CD4067B**	24
Quad bilateral switch	**CD4016B**	14
	CD4016A	14
Quad bilateral switch	**CD4066B**	14
	CD4066A	14
Digital (Data Selectors)		
Quad AND/OR select	**CD4019B**	16
	CD4019A	16
Dual 1-of-4 decoder/demultiplexer (outputs high)	**CD4555B**	16
Dual 1-of-4 decoder/demultiplexer (outputs low)	**CD4556B**	16
Quad 2-line-to-1-line	**CD40257B**	16
8-channel	**CD4512B**	16
Phase-Locked Loop		
Micropower	**CD4046B**	16
	CD4046A	16
Arithmetic Circuits		
Adders/Comparators		
4-bit full adder with parallel carry out	**CD4008B**	16
Triple serial adder, positive logic	**CD4032B**	16
Triple serial adder, negative logic	**CD4038B**	16
4-bit magnitude comparator	**CD4063B**	16
	CD4585B	16
Quad exclusive-OR gate	**CD4030B**	14
	CD4030A	14

Function	Type No.	No. of Pins
Arithmetic Circuits (Cont'd)		
Quad exclusive-OR gate	**CD4070B**	14
Quad exclusive-NOR gate	**CD4077B**	14
ALU/Rate Multipliers		
4-bit arithmetic logic unit	**CD40181B**	24
	CD4057A	28
BCD rate multiplier	**CD4527B**	16
Binary rate multiplier	**CD4089B**	16
Look-ahead-carry block	**CD40182B**	16
Parity Generator/Checker		
9-bit	**CD40101B**	14
Multiport Register		
4 X 4	**CD40108B**	24
4 X 4	**CD40208B**	24
8 X 1	**CD4034B**	24
8 X 1	**CD4034A**	24
Quad Bilateral Switches		
For transmission or multiplexing of analog or digital signals	**CD4016B**	14
	CD4016A	14
	CD4066B	14
	CD4066A	14
Industrial Controller		
16-channel precision timer/driver	**CD22401** ∇	40
Sync Generator		
TV Camera Sync Generator	**CD22402**	24
Telecommunication Circuits		
Crosspoint Switches		
4 X 4 crosspoint switch with control memory	**CD22100** ∇	16
4 X 4 X 2 crosspoint switch with control memory	**CD22101** ∇	24
4 X 4 X 2 crosspoint switch with control memory	**CD22102** ∇	24
HDB3 Transcoder		
HDB3 transcoder for 2.048/8.448 Mb/s transmission applications	**CD22103**∇	16
PCM Line Repeater		
PCM line repeater	**CD22301**∇	18
Timer/Driver		
16-channel precision timer/driver	**CD22401**∇	40
PCM Data Filters		
Pulse code modulation sampled-data filters	**CD22413**∇	16
	CD22414∇	16
Tone Generator		
Dual-tone multifrequency tone generator	**CD22859** ∇	16

∇ Indicates types designed for special applications. Ratings and characteristics data for these types differ in some aspects from the standardized data for A- and B-series types.

QMOS Digital Integrated Circuits

The QMOS line of high-speed CMOS products are functionally and pin compatible with many existing 54/74-series LSTTL bipolar products and 4000B-series CMOS digital logic types. QMOS products include a comprehensive set of buffers, transceivers, and registers that are popular in computer systems and a wide variety of popular logic MUX's, encoders/decoders, counters, arithmetic units, multivibrators, display drivers, and phase-locked loops.

Maximum Ratings, *Absolute-Maximum Values:*

DC SUPPLY-VOLTAGE, (V_{CC}):	
(Voltages referenced to ground)	-0.5 to +7 V
DC INPUT DIODE CURRENT, I_{IK} (FOR $V_I < -0.5$ V OR $V_I > V_{CC} +0.5$ V)	±20 mA
DC OUTPUT CURRENT, I_{OK} (FOR $V_O < -0.5$ V OR $V_O > V_{CC} +0.5$ V)	±20 mA
DC DRAIN CURRENT, PER OUTPUT (I_O) (FOR $-0.5 \text{ V} < V_O V_{CC} +0.5$ V):	
STANDARD OUTPUT	±25 mA
BUS DRIVER OUTPUT	±35 mA
DC V_{CC} OR GROUND CURRENT, PER PIN (I_{CC}):	
STANDARD OUTPUT	±50 mA
BUS DRIVER OUTPUT	±70 mA
POWER DISSIPATION PER PACKAGE (P_D):	
For T_A = -40 to +60°C (PACKAGE TYPE E)	500 mW
For T_A = +60 to +85°C (PACKAGE TYPE E)	Derate linearly at 8 mW/°C to 300 mW
For T_A = -55 to +100°C (PACKAGE TYPE F)	500 mW
For T_A = +100 to +125°C (PACKAGE TYPE F)	Derate Linearly at 8 mW/°C to 300 mW
OPERATING-TEMPERATURE RANGE (T_A):	
PACKAGE TYPE F	-55 to +125°C
PACKAGE TYPE E	-40 to +85°C
STORAGE TEMPERATURE (T_{stg})	-65 to +150°C
LEAD TEMPERATURE (DURING SOLDERING) FOR 10 s MAX.:	
At distance 1/16 ± 1/32 in. (1.59 ± 0.79 mm) from case for 10 s max.	+265°C
Unit inserted into a PC Board (min. thickness 1/16 in., 1.59 mm) with solder contacting lead tips only	+300°C

Static Electrical Characteristics for CD74HC/CD54HC and CD74HCT/CD54HCT Types*

CHARACTERISTIC	TEST CONDITIONS				V_{CC}	TEMPERATURE °C						UNITS

CMOS Logic Telecomunications ICs

Today's demanding telecommunications systems utilize digital electronic switching circuits to achieve the proper selection and correct circuit connections from among the multitude of possible interconnecting paths. RCA offers the following switching system devices:

- Several CMOS Single-Chip PCM (Pulse Code Modulated) CODECs with Filter and several CMOS Single-Chip, Full-Feature PCM CODECs that meet or exceed all AT&T D3/D4 specifications and CCITT recommendations
- Several CMOS Crosspoint Switches with Control Memory ranging from 4x4x1 and 4x4x2 arrays of transmission gates with 4-line-to-16-line decoders and 8x8x1 arrays with 6-line-to-64-line decoders.
- A Central Office quality Dual-Tone Multiple-Frequency (DTMF) Receiver that detects a selected group of 12 or 16 standard digits.
- A DTMF Receiver that detects all 16 standard digits.
- A CMOS HDB3 (High-Density Bipolar 3) Transcoder for 2.048/8.448 Mb/s transmission applications.
- A PCM Line Repeater for T1 carrier systems.
- In addition, selections from RCA's broad line of CD4000-series CMOS Logic ICs and from the QMOS (High-Speed CMOS) family of products can be used to provide multiplexing and demultiplexing, logic-level shifting and a variety of other circuit functions useful in telecommunications switching.

CMOS Single-Chip PCM CODECs with Filters

CD22302, CD22303
CD22354, CD22357

The RCA CD22302, CD22303, CD22354, and CD22357 are monolithic silicon-gate double-poly CMOS integrated circuits containing the band-limiting filters and the companding A/D and D/A conversion circuits that conform to the AT&T D3/D4 specifications and CCITT recommendations. The CD22302 and CD22354 provide the AT&T μ-law and the CD22303 and CD22357 provide the CCITT A-law companding characteristic.

The primary applications for these devices are in telephone systems. These circuits perform the analog and digital conversions between the subscriber loop and the PCM highway in a digital switching system.

Features:

- *Meets or exceeds all AT&T D3/D4 specifications and CCITT recommendations*
- *Complete CODEC and filtering systems:*
  - *No external components for sample and hold and Auto-Zero functions*
  - *Transmit Input section includes Anti-Aliasing Prefilter*
  - *Receive output filter with SIN X/X correction*
- *Variable Data Clocks–from 64 KHz to 4.1 MHz*
- *Programmable gain for transmit input*

Applications:

- *PABX*
- *Central office switching systems*
- *Accurate A/D and D/A conversions*
- *Digital telephones*

5-V Low-Power DTMF Receiver

CD22202E

The CD22202E complete dual-tone-multiple-frequency (DTMF) receiver detects a selectable group of 12 or 16 standard digits. No front-end pre-filtering is needed. The only externally-required components are an inexpensive 3.58-MHz TV "colorburst" crystal (for frequency reference) and a bias resistor. Extremely high system sensity is made possible by using the clock output of a crystal-connected CD22202E receiver to drive the time bases of additional receivers.

Features:

- *Central-office quality*
- *No front-end band splitting filters required*
- *Single, low-tolerance, 5-V supply*
- *Detects either 12 or 16 standard DTMF digits*
- *Uses inexpensive 3.579545-MHz crystal for reference*
- *Excellent speech immunity*
- *Output in either 4-bit hexadecimal code or binary coded 2-of-8*
- *Synchronous or handshake interface*
- *Three-state outputs*

5-V Low-Power Subscriber DTMF

CD22204E

The RCA-CD22204E is a complete Dual-Tone Multiple-Frequency (DTMF) receiver that detects all 16 standard digits. No front-end prefiltering is needed. The only externally required components are an inexpensive 3.58-MHz television "color-burst" crystal for frequency reference and a bias resistor. An Alternate Time Base (ATB) is provided to permit operation of up to ten CD22204Es from a single crystal.

Features:

- *No front-end band-splitting filters required*
- *Single low-tolerance 5-volt supply*
- *Three-state outputs for microprocessor-based systems*
- *Detects all 16 standard DTMF digits*
- *Uses inexpensive 3.579545-MHz crystal*
- *Excellent speech immunity*
- *Output in 4-bit hexadecimal code*

CMOS Logic Telecommunications ICs

PCM Line Repeater

CD22301

The RCA-CD22301 monolithic PCM repeater circuit is designed for T1 carrier systems operating with a bipolar pulse train of 1.544 Mbits/s. It can also be used in the T148 carrier system operating with a ternary pulse train of 2.37 Mbits/s. The circuit operates from a 5.1 V ±5% externally regulated supply.

Features:

- *Automatic line buildout*
- *5.1-V supply voltage*
- *Buffered output*

Applications:

- *T1 1.544 Mbits/s bipolar carrier system*
- *T148 2.37 Mbits/s ternary carrier system*

1200-Baud FSK Modem

CD22223E

The RCA-CD22223E 1200-baud modem is intended for half-duplex operation over a single-line system or full-duplex operation over a two-line system.

Features:

- *Built-in loop-back test*
- *Switched capacitor receive filter*
- *Low power CMOS (2 mA @ 5-V typ.)*
- *Single-supply operation*
- *Low error rate (5 x 10^{-3} @ 8-dB SNR)*

Dual-Tone Multifrequency Generator

CD22859

The RCA-CD22859 is a CMOS dual-tone multifrequency (DTMF) tone generator for use in dual-tone telephone dialing systems. The device can easily be interfaced to a standard pushbutton telephone keyboard, to provide enabling operation directly with the telephone lines.

Features:

- *Mute drivers on chip*
- *Device power can either be regulated dc or telephone loop current*
- *Use of an inexpensive 3.579545-MHz TV crystal provides high accuracy and stability for all frequencies*

HDB3 (High-Density Bipolar 3) Transcoder for 2.048/8.448 Mb/s Transmission Applications

CD22103A

The RCA-CD22103A is an LSI SOS integrated circuit which performs the HDB3 transmission coding and reception decoding functions with error detection. It is used in 2.048 and 8.448 Mb/s transmission applications. The CD22103A performs HDB3 coding and decoding for data rates from 50 kb/s to 10 Mb/s in a manner consistent with CCITT G703 recommendations.

Features:

- *HDB3 coding and decoding for data rates from 50 Kb/s to 10 Mb/s in a manner consistent with CCITT G703 recommendations*
- *HDB3/AMI transmission coding/reception decoding with code error detection performed in independent coder and decoder sections*
- *All transmitter and receiver inputs/outputs are TTL compatible*
- *Internal Loop Test capability*

4 x 4 Crosspoint Switch with Control Memory

CD22100

4 x 4 x 2 Crosspoint Switches with Control Memory

CD22101, CD22102

The RCA-CD22100, CD22101, and CD22102 consist of a 4 x 4 (CD22100) and 4 x 4 x 2 (CD22101 and CD22102) array of crosspoints (transmission gates) with a 4-line-to-16-line decoder and 16 latch circuits. Any one of the sixteen transmission gates can be selected by applying the appropriate four-line address, and any number of crosspoints can be ON simultaneously. Corresponding crosspoints in each array are turned on and off simultaneously, also.

Features:

- *Low ON resistance-75 Ω typ. at $V_{DD} = 12$ V*
- *"Built-in" latched inputs*
- *Large analog signal capability-$\pm V_{DD}/2$*
- *10-MHz switch bandwidth*
- *Matched switch characteristics*
  $\Delta R_{ON} = 18\ \Omega$ *typ. at* $V_{DD} = 12$ *V (CD22100)*
  $\Delta R_{ON} = 5\ \Omega$ *typ. at* $V_{DD} = 12$ *V (CD22101, CD22102)*
- *Standard CMOS noise immunity*

Applications:

- *Telephone systems*
- *PBX*
- *Studio audio switching*
- *Multisystem bus interconnect*

High Performance CMOS Logic – KS54/74AHCT, KS54/74HCTLS

FEATURES

- KS54/74AHCT Family is a direct plug-in replacement for 54/74ALS
- KS54/74HCTLS Family is a direct plug-in replacement for industry standard 54/74LS, 54/74HC and 54/74HCT
- Output drive currents: 24mA (V_{OL} = 0.5V)
- ESD; over 3500 volts

GENERAL DESCRIPTION

The 54/74AHCT Advanced High-Speed CMOS and the 54/74HCTLS High-Speed CMOS logic families were designed to combine the most desirable features of their predecessors: the low power, wide operating supply and temperature ranges, superior noise immunity, rail-to-rail output voltage swings and low input currents of CMOS on the one hand, and the very high-speeds and drive capability on the other (Figure 1).

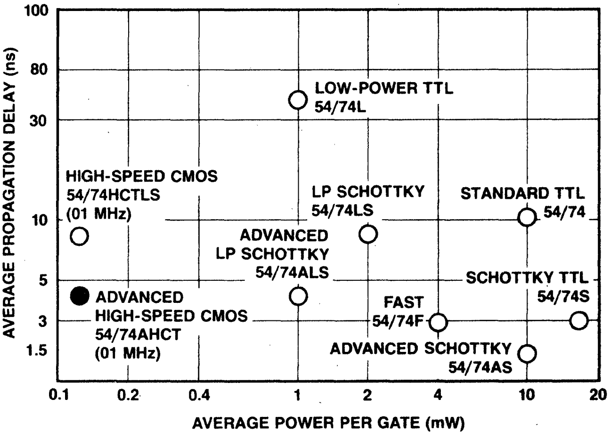

Figure 1. Power Dissipation vs gate delay characteristics for a two-input NAND gate implemented in various bipolar and CMOS technologies.

These are the exact functional equivalents of the 54/74ALS and 54/74LS parts and can readily replace them to reduce power dissipation in existing designs. Note that they also provide equivalent drive capability to LS and ALS logic which is much more than that of the earlier high-speed CMOS logic families, the 54/74HC and the 54/74HCT. A comparison of the key characteristics for an octal buffer illustrates this very clearly in Figure 2.

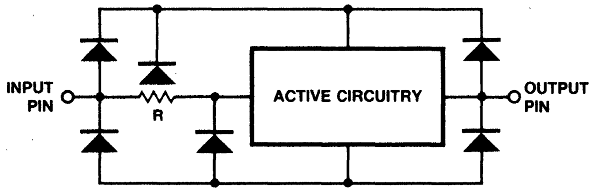

Figure 2. The input and output protection circuitry of 54/74AHCT and 54/74HCTLS parts.

All AHCT and HCTLS parts are fully characterized for operation over the 4.5 and 5.5V power supply range and the industrial and military temperature ranges:

74AHCT and 74HCTLS are characterized over −40°C to +85°C

54AHCT and 54HCTLS are characterized over −55°C to +125°C

Notice that the commercial operating range of ALS, LS and FAST families is 0°C to 70°C which is much narrower than that of the AHCT and HCTLS. Also the supply operating range of the 74LS and 74FAST families is 4.75 to 5.25V as opposed to 4.5 to 5.5V for AHCT and HCTLS.

ESD AND LATCHUP PROTECTION

Historically, MOS devices have always been considered as more susceptible to ESD damage than others. This is not the case for the AHCT and HCTLS families: special design and processing have actually improved the ESD immunity to where it is actually much better than that of bipolar logic. The MIL-STD 38510 ESD test shows that all inputs and outputs of AHCT and HCTLS devices are well protected against voltage transients of at least 3500V. The protection circuitry used for this purpose is illustrated in Figure 2.

Latchup immunity is another strong attribute of the AHCT and HCTLS families. Latchup results when input or output protection diodes are forward-biased because of voltages above V_{CC} and below ground. The current required to cause latchup at AHCT/HCTLS inputs or outputs is typically above 200 mA which is well over the practical currents that one may encounter in normal operation.

Technology Selection Guide

DEVICE NUMBER	DESCRIPTION	STD	S	LS	FAST	HC	HCT
00	Quad 2-Input NAND Gate	A	A	A	A	A	A
01	Quad 2-Input NAND Gate, OC			A			
02	Quad 2-Input NOR Gate	A	A	A	A	A	A
03	Quad 2-Input NAND Gate	A	A			A	A
04	Hex Inverter	A	A	A	A	A	A
05	Hex Inverter, OC	A	A	A			
06	Hex Inverter Buffer/Driver, OC	A					
07	Hex Buffer/Driver, OC	A					
08	Quad 2-Input AND Gate	A	A	A	A	A	A
09	Quad 2-Input AND Gate, OC			A			
10	Triple 3-Input NAND Gate	A	A	A	A	A	A
11	Triple 3-Input AND Gate	A	A	A	A	A	A
13	Dual 4-Input NAND Schmitt Trigger	A		A	A		
14	Hex Inverter Schmitt Trigger	A		A	A	A	A
16	Hex Inverter Buffer/Driver, OC	A					
17	Hex Buffer/Driver, OC	A					
20	Dual 4-Input NAND Gate	A	A	A	A	A	A
21	Dual 4-Input AND Gate	A		A		Q2 86	Q2 86
25	Dual 4-Input NOR with Strobe	A					
26	Quad 2-Input NAND Gate, OC	A		A			
27	Triple 3-Input NOR Gate	A		A	A	A	A
28	Quad 2-Input NOR Buffer	A					
30	8-Input NAND Gate	A		A	A	2H 86	1H 86
32	Quad 2-Input OR Gate	A	A	A	A	A	A
33	Quad 2-Input NOR Buffer, OC	A		A			
37	Quad 2-Input NAND Buffer	A	A	A	A		
38	Quad 2-Input NAND Buffer, OC	A	A	A	A		
39	Quad 2-Input NAND Buffer, OC	A					
40	Dual 4-Input NAND Buffer	A	A	A	A		
42	BCD-to-Decimal Decoder	A		A		Q1 86	Q1 86
45	BCD-to-Decimal Decoder/Driver, OC	A					
50	Expandable Dual 2-Wide 2-Input AOI Gate	A					
51	Dual 2-Wide 2-Input AOI Gate	A	A	A	A		
54	4-Wide 2-Input AOI Gate			A			
58	Dual 4-Input AND/OR Gate					A	A
64	4-2-3-2 Input AOI Gate		A		A		
73	Dual J-K Master-Slave Flip-Flop	A		A		A	A
74	Dual D-Type Positive Edge-Triggered Flip-Flop	A	A	A*	A	A	A
75	Quad Bistable Latch	A		A		A	A
76	Dual J-K Master-Slave Flip-Flop	A		A			
83	4-Bit Binary Full Adder, Ripple Carry	A		A*			
85	4-Bit Magnitude Comparator	A	A	A	A	A	A
86	Quad 2-Input EXCLUSIVE-OR Gate	A	A	A	A	A	A
90	Decade Ripple Counter	A		A			
91	8-Bit Shift Register	A					
92	Divide-by-12 Counter	A		A			
93	4-Bit Binary Ripple Counter	A		A		A	A
94	4-Bit PISO Shift Register	A					
95	4-Bit Shift Register	A		A**			
96	5-Bit Shift Register	A		A			
107	Dual J-K Master-Slave Flip-Flop	A		A		A	A
109	Dual J-K Positive Edge-Triggered Flip-Flop	A		A*	A	A	A
112	Dual J-K Negative Edge-Triggered Flip-Flop		A	A	2H 85	A	A
113	Dual J-K Negative Edge-Triggered Flip-Flop		A	A	2H 85		
114	Dual J-K Negative Edge-Triggered Flip-Flop				2H 85		
116	Dual 4-Bit Latch with Clear	A					

*A Version; **B Version; A = Available; 2H 85 = 2nd Half of 1985; Q1 86 = 1st Quarter of 1986; Q2 86 = 2nd Quarter of 1986.

8-Bit Odd/Even Parity Checker	180
8-Bit Parity Generator/Checker	8262
8-Bit Parity Generator/Checker	82S62
9-Bit Odd/Even Parity Generator/Checker	280
13-Bit Parity Generator/Checker	4531

SPECIAL FUNCTIONS

FUNCTION	DEVICE NUMBER
64-Bit FAST Random Access Memory	189
Memory Error Detector/Corrector, 3-State	630
Memory Error Detector/Corrector, OC	631
Dual-Port RAM Controller with Dynamic Memory Refresh	764
Dual Port RAM Controller without Latch	765
IEC/IEEE Bus Interface	4738
Frequency Synthesizer	4750
A.C. Motor Control Circuit	4752
18-Element Bar Graph LCD Driver	4754

▨ Function not continued in this manual. Please check Technology Selection Guide for appropriate technology—FAST or CMOS.

D — Direct interface
P — Pullup resistor required
T — Level translator required

10K & 100K ECL Product List

10K ECL

DEVICE TYPE	DESCRIPTION
10100	Quad 2-Input NOR Gate
10101	Quad OR/NOR Gate
10102	Quad 2-Input NOR Gate
10103	Quad 2-Input OR Gate
10104	Quad 2-Input AND Gate
10105	Triple 2-3-2 Input OR/NOR Gate
10106	Triple 4-3-3 Input NOR Gate
10107	Triple 2-Input Exclusive-OR/Exclusive-NOR Gate
10108	Dual 3-Input AND/NAND Gate
10109	Dual 4-5 Input OR/NOR Gate
10110	Dual 3-Input/3-Output OR Gate (Line Driver)
10111	Dual 3-Input/3-Output NOR Gate (Line Driver)
10112	Dual 3-Input/3-Output (1 OR and 2 NOR) (Line Driver)
10113	Quad Exclusive-OR Gate with Enable
10114	Triple Line Receiver
10115	Quad Line Receiver
10116	Triple Line Receiver
10117	Dual 2-Wide 2-3 Input OR-AND/OR-AND-INVERT Gate
10118	Dual 2-Wide 3-Input OR-AND Gate
10119	4-Wide 4-3-3-3 Input OR-AND Gate
10121	4-Wide OR-AND/OR-AND-INVERT Gate
10123	Triple 4-3-3-Input Bus Driver
10124	Quad TTL to ECL Translator
10125	Quad ECL to TTL Translator
10129	Quad TTL/IBM Bus Receiver/Latch
10130	Dual D-Type Latch
10131	Dual D-Type Master-Slave Flip-Flop
10132	Dual 2-Input Multiplexer with Clocked D-Type Latches and Common Reset
10133	Quad Latch with D-Type Inputs and Enable Outputs

DEVICE TYPE	DESCRIPTION
10134	Dual 2-Input Multiplexer with Clocked D-Type Latches
10135	Dual JK Master-Slave Flip-Flop
10136	Universal Hexadecimal Counter
10137	Universal Decade Counter
10141	4-Bit Universal Shift Register
10149	1024-Bit, 4-Bits per Word PROM
10155	16-Bit, 2-Bits per Word CAM
10158	Quad 2-to-1 Multiplexer (Non-Inverting)
10159	Quad 2-to-1 Multiplexer (Inverting)
10160	12-Bit Parity Checker/Generator
10161	3-Bit Decoder with 2 Enable Inputs (1-of-8 LOW)
10162	3-Bit Decoder with 2 Enable Inputs (1-of-8 HIGH)
10164	8-Input Multiplexer with Enable Input
10165	8-Input Priority Encoder
10171	Dual 2-Bit Decoder (1-of-4 Lines LOW)
10172	Dual 2-Bit Decoder (1-of-4 Lines HIGH)
10173	Quad 2-Input Multiplexer with Latched Outputs
10174	Dual 4-to-1 Multiplexer (with Enable)
10175	Quint D-Latch w/Com Reset and 2 Wired-OR Com Clock Inputs
10176	Hex D-Type Master-Slave Flip-Flop
10179	Look-Ahead Carry Block-Arithmetic Functions
10180	Dual High-Speed Adder/Subtractor
10181	4-Bit Logic Unit/Function Generator
10188	Hex Buffer (Non-Inverting)
10189	Hex Inverter
10192	Quad Differential Line Driver
10210	Dual 3-Input/3-Output (High-Speed) OR Gate
10211	Dual 3-Input/3-Output (High-Speed) NOR Gate
10216	Triple Differential OR/NOR Line Receiver (High-Speed)
10231	Dual Type-D Master-Slave Flip-Flop (High-Speed)

100K ECL

DEVICE TYPE	DESCRIPTION
100101	Triple 5-Input OR/NOR Gate
100102	Quint 2-Input OR/NOR Gate
100107	Quint Exclusive-OR/NOR
100112	Quad Driver
100113	Quad Driver
100114	Quint Differential Line Receiver
100117	Triple AOI
100118	5-Wide AOI
100122	9-Gate Buffer
100123	Hex Bus Driver
100124	Hex TTL to ECL Translator
100125	Hex ECL to TTL Translator
100126	Back Plane Driver
100131	Triple D Flip-Flop
100136	Multipurpose Counting Register
100141	8-Bit Universal Shift Register
100145	16 × 4 Register File
100150	Hex D Latch
100151	Hex D Flip-Flop

DEVICE TYPE	DESCRIPTION
100155	Quad Multiplexer/Latch
100158	8-Bit Shift Matrix
100160	Dual 9-Bit Parity Generator
100163	Dual 8-Input Multiplexer
100164	16-Input Multiplexer
100165	Universal Priority Encoder
100166	9-Bit Comparator
100170	Universal Decoder
100171	Triple 4-Input Multiplexer
100175	100K–10K Translator
100179	Look Ahead Carry Generator
100180	Fast 6-Bit Adder
100181	4-Bit ALU Binary/Decimal
100255	TTL-100K Translator/Bidirectional
SAF/SAB1034	4-to-1 ECL Frequency Divider
SAF/SAB1534	4-to-1 ECL Frequency Divider

10K & 100K ECL Selection Guide

DEVICE TYPE	DESCRIPTION
OR/NOR Gates	
10100	Quad 3-Input NOR (1 Input Common)
10101	Quad 2-Input OR/NOR (1 Input Common)
10102	Quad 2-Input 3 NOR and 1 OR/NOR
10103	Quad 2-Input 3 OR and 1 OR/NOR
10105	Triple 2-3-2 Input OR/NOR
10106	Triple 4-3-3 Input NOR
10109	Dual 4-5 Input OR/NOR
10110	Dual 3-Input/3-Output OR (Line Driver)
10111	Dual 3-Input/3-Output NOR (Line Driver)
10210	High-Speed Dual 3-Input/3-Output OR
10211	High-Speed Dual 3-Input/3-Output NOR
100101	Triple 5-Input OR/NOR
100102	Quint 2-Input OR/NOR
Exclusive OR/NOR Gates	
10107	Triple 2-Input Exclusive-OR/Exclusive-NOR
10113	Quad Exclusive-OR (With Enable)
100107	Quint Exclusive-OR/Exclusive-NOR
AND, AND/NAND Gates	
10104	Quad 2-Input AND
10108	Dual 3-Input AND/NAND
AND-OR-Invert Combination Gates	
10117	Dual 2-Wide 2-3 Input OR-AND/OR-AND-Invert
10118	Dual 2-Wide 3-Input OR-AND
10119	4-Wide 4-3-3-3 Input OR-AND
10121	4-Wide OR-AND/OR-AND-Invert
100117	Triple 2-2-1 Input OR/AND
10118	Quint 5-4-4-4-2 Input OR/AND
Buffer Gates	
10188	Hex Buffer
10189	Hex Inverter
100122	9 Buffer Gates
Flip-Flops	
10131	Dual D-Type Master-Slave
10176	Hex D-Type Master-Slave
10231	High-Speed Dual D-Type Master-Slave
100131	Triple D
100151	Hex D Master-Slave
10135	Dual JK Master-Slave
Latch	
10130	Dual D-Type
10133	Quad with D-Type Inputs and Enable Outputs
10175	Quint D, Common Reset, 2-Wired-OR Common Clock Inputs
100150	Hex D
Registers/Shift Registers	
10141	4-Bit Universal Shift Register
100136	4-Stage Counter/Shift Register
100141	8-Bit Shift Register
100145	16 x 4-Bit Register File
100158	8-Bit Shift Matrix
Counters	
10136	Universal Hexadecimal
10137	Universal Decade
100136	4-Stage Counter/Shift Register

DEVICE TYPE	DESCRIPTION
Multiplexers/Encoders	
10132	Dual 2-Input Multiplexer with Clocked D Latches and Common Reset
10134	Dual 2-Input Multiplexer with Clocked D Latches
10158	Quad 2-to-1 Multiplexer (Non-Inverting)
10159	Quad 2-to-1 Multiplexer (Inverting)
10164	8-Input Multiplexer with Enable Input
10165	8-Input Priority Encoder
10173	Quad 2-Input Multiplexer with Latched Outputs
10174	Dual 4-to-1 Multiplexer with Enable
100155	Quad Multiplexer with Latch
100163	Dual 8-Line Multiplexer
100164	16-Line Multiplexer
100165	Universal Priority Encoder
100171	Triple 4-Line Multiplexer
Decoders/Demultiplexer	
10161	1-of-8 Lines (LOW) With Two Enable Inputs
10162	1-of-8 Lines (HIGH) With Two Enable Inputs
10171	Dual 1-of-4 Lines (LOW)
10172	Dual 1-of-4 Lines (HIGH)
100170	Universal Decoder/Demux
Arithmetic Operators	
10160	12-Bit Parity Checker/Generator
10179	Look-Ahead Carry Block
10180	Dual 2-Bit Adder/Subtractor
10181	4-Bit Arithmetic Logic Unit
100160	9-Bit Parity/8-Bit Comparator
100166	9-Bit Magnitude Comparator
100179	Look Ahead Carry Generator
100180	High-Speed Adder
100181	4-Bit Arithmetic Logic Unit
Bus and Line Drivers	
10110	Dual 3-Input/3-Output OR Line Drivers
10111	Dual 3-Input/3-Output NOR Line Driver
10112	Dual 3-Input/3-Output Line Driver
10123	Triple 4-3-3 Input Bus Driver
10192	Quad Differential Line Driver
100112	Quad High Fan-Out Driver
100113	Line Driver
100123	Hex Bus Driver
100126	Back Plane Driver
Receivers	
10114	Triple Line Receiver
10115	Quad Line Receiver
10116	Triple Line Receiver
10129	Quad TTL/IBM Bus Receiver
10216	Triple Differential OR/NOR Line Receiver
100114	Quint Line Receiver
Translators	
10124	Hex TTL to ECL Translator
10125	Hex ECL to TTL Translator
10129	Quad TTL/IBM Bus Receiver/Latch
100175	100K–10K Translator
Memories	
10149	1024-Bit, 4 Bits per Word PROM
10155	16-Bit, 2 Bits per Word CAM

8200/82S00/9300/9600 Availability Guide

DEVICE TYPE	DESCRIPTION	AVAIL-ABILITY
8234	2-Input, 4-Bit Digital Multiplexer	A
82S41	Quad Exclusive-OR Gate	C
8242	Quad Exclusive-NOR Gate	C
82S42	Quad Exclusive-NOR Gate	C
82S50	Binary-to-Octal Decoder	C
82S52	BCD-to-Decimal Decoder	C
8262	8-Bit Parity Generator/Checker	C
82S62	8-Bit Parity Generator/Checker	C
8266	2-Input, 4-Bit Digital Multiplexer	A
8271	4-Bit Shift Register	A
82S71	4-Bit Shift Register	C
8273	10-Bit SIPO Shift Register	A
8274	10-Bit PISO Shift Register	C
82S82	4-Bit Arithmetic Unit	C
82S83	4-Bit BCD Adder	C
8815	Dual 4-Input NOR	C
8881	Quad 2-Input NAND, OC	C
8890	Hex Inverter	C
8891	Hex Inverter	A
9301	BCD-to-Decimal Decoder	A
9309	Dual 4-Input Multiplexer	A
9310	4-Bit Decade Counter	C
9312	8-Input Digital Multiplexer	A
9316	4-Bit Binary Counter	C
9322	Data Selector/Multiplexer	C
9324	5-Bit Comparator	C
9334	8-Bit Addressable Latch	A
9386	Quad Exclusive-NOR	A
9601	Retriggerable Monostable Multivibrator	A
9602	Dual Monostable Multivibrator	C
8T09	Quad Bus Driver, 3-State	A
8T10	Quad D-Type Bus Latch	A
8T13	Dual Line Driver	A
8T15	Dual EIA/MIL Line Receiver	C
8T16	Dual Communications EIA/MIL Line Receiver	A

A = Available in Military C = Commercial Grade Only

DEVICE TYPE	DESCRIPTION	AVAIL-ABILITY
8T20	Bidirectional Monostable Multivibrator	C
8T22	Retriggerable Monostable Multivibrator (74122, 9601)	C
8T23	Dual Line Driver for IBM 360/370 Interface (75123)	C
8T24	Triple Line Receiver for IBM 360/370 Interface (75124)	C
8T26A	Quad Bus Driver/Receiver	A
8T28	Quad Bus Driver/Receiver, Non-Inverting	A
8T34	Quad Bus Transceiver (DM8834)	C
8T37	Hex Bus Receiver (DM8837)	C
8T38	Quad Bus Transceiver (DM8838)	C
8T95	Hex Buffer	C
8T96	Hex Inverter	C
8T97	Hex Buffer	A
8T98	Hex Inverter	A
8T125	Octal Transceiver, Inverting	A
8T126	Quad Bus Driver/Receiver, Inverting	A
8T127	Quad Bus Driver/Receiver, Inverting	A
8T128	Quad Bus Driver/Receiver, Non-Inverting	A
8T129	Quad Bus Driver/Receiver, Non-Inverting	A
8T245	Octal Transceiver	C
8T380	Quad Bus Receiver	C

FAST™ Product Availability Guide

DEVICE	PIN	DESCRIPTION	AVAIL-ABILITY
74F00	14	Quad 2-Input NAND Gate	A
74F02	14	Quad 2-Input NOR Gate	A
74F04	14	Hex Inverter	A
74F08	14	Quad 2-Input AND Gate	A
74F10	14	Triple 2-Input NAND Gate	A
74F11	14	Triple 2-Input AND Gate	A
74F13	14	Dual 4-Input NAND Schmitt Trigger	A
74F14	14	Hex Inverter Schmitt Trigger	A
74F20	14	Dual 4-Input NAND Gate	A
74F27	14	Triple 3-Input NOR Gate	A

74F40	14	Quad 4-Input NAND Buffer	A
74F51	14	Dual 2-Wide 3-Input, 2-Wide 2-Input AND-OR-INVERT Gate	A
74F64	14	4-2-3-2-Input AND/OR Invert Gate	A
74F74	14	Dual D-Type Flip-Flop	A
74F83	16	4-Bit Adder with Fast Carry	A
74F85	16	4-Bit Magnitude Comparator	A
74F86	14	Quad 2-Input Exclusive-OR Gate	A
74F109	16	Dual JK Positive Edge Triggered Flip-Flop	A
74F112	16	Dual JK Negative Edge Triggered Flip-Flop	Q2 '86
74F113	16	Dual JK Negative Edge Triggered Flip-Flop w/o Reset	Q2 '86
74F114	16	Dual JK Negative Edge Triggered Flip-Flop	Q2 '86
74F125	14	Quad Buffer (3-State)	A
74F126	14	Quad Buffer (3-State)	A
74F132	16	Quad 2-Input NAND Schmitt Trigger	A
74F138	16	1-of-8 Decoder/Demultiplexer	A
74F139	16	Dual 1-of-4 Decoder/ Demultiplexer	A
74F148	16	8-Line to 3-Line Priority Encoder	A
74F151	16	8-Input Multiplexer	A
74F153	16	Dual 4-Input Multiplexer	A
74F157A	16	Quad 2-Input Multiplexer (INV)	A
74F157	16	Quad 2-Input Multiplexer (INV)	A
74F158A	16	Quad 2-Input Multiplexer (NINV)	A
74F158	16	Quad 2-Input Multiplexer (NINV)	A
74F160A	16	BCD Decade Counter, Asynchronous Reset	A
74F161A	16	4-Bit Binary Counter, Asynchronous Reset	A
74F162A	16	BCD Decade Counter, Synchronous Reset	A

A = Available *no SMD yet.
Q1' 86 = 1st Quarter of 1986 Q2 '86 = 2nd Quarter of 1986 Q3 '86 = 3rd Quarter of 1986

DEVICE	PIN	DESCRIPTION	AVAIL-ABILITY
74F163A	16	4-Bit Binary Counter, Synchronous Reset	A
74F164	16	8-Bit SIPO Shift Register	Q1 '86
74F165	16	8-Bit S/PISO Shift Register	Q1 '86
74F166	16	8-Bit S/PISO Shift Register	A
74F168	16	4-Bit Up/Down BCD Decade Synch. Counter (3-State)	A
74F169	16	4-Bit Up/Down Binary Synch. Counter (3-State)	A
74F174	16	Hex D Flip-Flop w/Master Reset	A
74F175	16	Quad D Flip-Flop w/Master Reset	A
74F181	24	4-Bit Arithmetic Logic Unit	A
74F182	16	Carry Look-Ahead Generator	A
74F189	16	4-Bit Random Access Memory (3-State)	Q2 '86
74F190	16	Asynch. Presettable Up/Down BCD Decade Counter	Q1 '86
74F191	16	Asynch. Presettable 4-Bit Up/Down Binary Counter	Q1 '86
74F192	16	Synch. Presettable Up/Down BCD Decade Counter	Q1 '86
74F193	16	Synch. Presettable 4-Bit Up/Down Binary Counter	Q1 '86
74F194	16	4-Bit Bidirectional Universal Shift Register	A
74F195	16	4-Bit Parallel Access Shift Register	A
74F198	24	8-Bit Bidirectional Universal Shift Register	A
74F199	24	8-Bit Parallel Access Shift Register	A
74F240	20	Octal Inverting Bus/Line Driver (3-State)	A
74F241	20	Octal Bus/Line Driver (3-State)	A
74F242	14	Quad Inverting Bus Transceiver (3-State)	A
74F243	14	Quad Bus Transceiver (3-State)	A
74F244	20	Octal Bus/Line Driver (3-State)	A
74F245	20	Octal Bus Transceiver (3-State)	A
74F251	16	8-Input Multiplexer (3-State)	A
74F253	16	Dual 4-Input Multiplexer (3-State)	A
74F256	16	Dual 4-Bit Addressable Latch	A
74F257A	16	Quad 2-Input Multiplexer NINV (3-State)	A
74F257	16	Quad 2-Input Multiplexer NINV (3-State)	A
74F258A	16	Quad 2-Input Multiplexer INV (3-State)	A
74F258	16	Quad 2-Input Multiplexer INV (3-State)	A
74F259	16	8-Bit Addressable Latch	A
74F260	14	Dual 5-Input NOR Gate	A
74F269	24	8-Bit Bidirectional Binary Counter (3-State)	A

Plastic SO[1]	N74F--D

NOTE:
1. SO package is surface-mounted micro-miniature DIP.

FAST™ Family Characteristics

ABSOLUTE MAXIMUM RATINGS

(Operation beyond the limits set forth in this table may impair the useful life of the device. Unless otherwise noted these limits are over the operating free-air temperature range.)

SYMBOL	PARAMETER		74F	UNIT
V_{CC}	Supply voltage		– 0.5 to +7.0	V
V_{IN}	Input voltage		– 0.5 to +7.0	V
I_{IN}	Input current		– 30 to +5	mA
V_{OUT}	Voltage applied to output in HIGH output state		– 0.5 to V_{CC}	V
I_{OUT}	Current applied to output in LOW output state	Standard outputs	40	mA
		3-State outputs	48	mA
		Buffer outputs	128	mA
T_A	Operating free-air temperature range		0 to 70	°C

NOTE:

1. For 3-State outputs, $V_{OUT} = -0.5V$ to $5.5V$ with $V_{CC} = 0V$.

RECOMMENDED OPERATING CONDITIONS

SYMBOL	PARAMETER		74F			UNIT
			Min	Typ	Max	
V_{CC}	Supply voltage		4.5	5.0	5.5	V
V_{IH}	HIGH-level input voltage		2.0			V
V_{IL}	LOW-level input voltage				0.8	V
I_{IK}	Input clamp current				– 18	mA
V_{OH}	HIGH-level output voltage	Open collector			4.5	V
I_{OH}	HIGH-level output current	Standard outputs			– 1	mA
		3-State outputs			– 3	mA
		Buffer outputs			– 15	mA
I_{OL}	LOW-level output current	Standard outputs			20	mA
		3-State outputs			24	mA
		Buffer outputs			64	mA
T_A	Operating free-air temperature range		0		70	°C

		Buffer Driver		−100		−225	µA	Max	V_{OUT} = 0V

NOTE:

1. Unless otherwise noted, conditions and limits apply throughout the temperature range for which the particular device type is rated. The ground pin is the reference level for all applied and resultant voltages.
2. Unless otherwise stated on individual data sheets.
3. Typical characteristics refer to T_A = +25°C and V_{CC} = +5.0V.
4. Min and Max refer to the values listed in the data sheet table of recommended operating conditions.
5. Standard refers to the totem-pole pull-up circuitry commonly used for the particular family, as distinguished from buffers, line drivers or 3-state outputs.
6. On certain part types, Signetics uses a high impedance NPN base input structure to enhance device performance. Parts which have this structure are indicated in the FAST Data Manual. NPN inputs are tested with V_{CC} = 0V and 7.0V at the input. It is necessary to turn V_{CC} off for the NPN input test to measure leakage. Otherwise, the current source is on and the leakage is undetectable.
7. For testing I_{OS}, the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operation values. Otherwise, prolonged shorting of a HIGH output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} test should be performed last.

Logic Products

FAST 74F160A, 74F161A, 74F162A, 74F163A
Counters

'F160A, 'F162A BCD Decade Counter
'F161A, 'F163A 4-Bit Binary Counter
Preliminary Specification

FEATURES

- **Synchronous counting and loading**
- **Two Count Enable inputs for n-bit cascading**
- **Positive edge-triggered clock**
- **Asynchronous reset ('F160A, 'F161A)**
- **Synchronous reset ('F162A, 'F163A)**
- **High-speed synchronous expansion**
- **Typical count rate of 120MHz**

DESCRIPTION

Synchronous presettable decade ('F160A, 'F162A) and 4-bit ('F161A, 'F163A) counters feature an internal carry look-ahead and can be used for high-speed counting. Synchronous operation is provided by having all flip-flops clocked simultaneously on the positive-going edge of the clock. The Clock input is buffered.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)
74F160A	120MHz	40mA
74F161A	120MHz	40mA
74F162A	120MHz	40mA
74F163A	120MHz	40mA

Signetics

FAST 74F269
8-Bit Counter

8-Bit Bidirectional Binary Counter
Product Specification

Logic Products

FEATURES

- **Synchronous counting and loading**
- **Built-in lookahead carry capability**
- **Count frequency 115MHz typ**
- **Supply current 95mA typ**

DESCRIPTION

The 'F269 is a fully synchronous 8-stage up/down counter featuring a preset capability for programmable operation, carry lookahead for easy cascading and a U/$\overline{D}$ input to control the direction of counting. All state changes, whether in counting or parallel loading, are initiated by the rising edge of the clock.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)
74F269	115MHz	95mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE $V_{CC} = 5V \pm 10\%$; $T_A = 0°C$ to $+70°C$
Plastic DIP	N74F269N
Plastic SOL-24	N74F269D

NOTES:
1. SO package is surface-mounted micro-miniature DIP.
2. For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

Buffers/Drivers

'F455 Octal Buffer/Line Driver with Parity, Inverting (3-State)
'F456 Octal Buffer/Line Driver with Parity, Inverting (3-State)
Product Specification

FEATURES

- **High impedance NPN base inputs for reduced loading (20μA in HIGH and LOW states)**
- **'F455 combines 'F240 and 'F280A functions in one package**
- **'F456 combines 'F241 and 'F280A functions in one package**
- **'F455A and 'F456A are center pin versions of the 'F655A and 'F656A respectively**
- **'F455 Inverting**
  'F456 Non-inverting
- **3-State outputs sink 64mA and source 15mA**
- **24-pin plastic slim DIP (300 mil) package**
- **Inputs on one side and outputs on the other side simply PC board layout**

DESCRIPTION

The 'F455 and 'F456 are octal buffers and line drivers with parity generation/checking designed to be employed as memory address drivers, clock drivers and bus-oriented transmitters/receivers. These parts include parity generator/checker to improve PC board density.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74F455	3.5ns	70mA
74F456	4.5ns	70mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE $V_{CC} = 5V \pm 10\%$; $T_A = 0°C$ to $+70°C$
Plastic DIP	N74F455N, N74F456N
Plastic SOL-24	N74F455D, N74F456D

NOTE:
1. SO package is surface-mounted micro-miniature DIP.

FAST 74F579
Counter

8-Bit Bidirectional Binary Counter (3-State)
Product Specification

Logic Products

FEATURES

- **Multiplexed 3-state I/O ports for bus-oriented applications**
- **Built-in lookahead carry capability**
- **Count frequency 115MHz typ**
- **Supply current 100mA typ**
- **Fully synchronous operation**
- **$U/\overline{D}$ to control direction or counting**
- **Separate pins for Master**
- **Reset and Synchronous Reset**
- **Center power pins to Reduce effects of package inductance**
- **See 'F269 for 24-pin separate I/O port version**
- **See 'F779 for 16 pin version**

DESCRIPTION

The 'F579 is a fully synchronous 8-stage up/down counter with multiplexed 3-state I/O ports for bus-oriented applications. It features a preset capability for programmable operation, carry lookahead for easy cascading and a $U/\overline{D}$ input to control the direction of counting. All state changes, whether in counting or parallel loading, are initiated by the rising edge of the clock.

FAST 74F620, F623
Transcievers

Octal Bus Transceiver
('F620 — Inverting 3-State)
('F623 — Non-Inverting 3-State)
Product Specification

FEATURES

- High impedance NPN base inputs for reduced loading (20μA in HIGH and LOW states)
- Ideal for applications which require high output drive and minimal bus loading
- Octal bidirectional bus interface
- 3-State buffer outputs sink 64mA and source 15mA
  - 'F620, inverting
  - 'F623, non-inverting

DESCRIPTION

The 'F623 is an octal transceiver featuring non-inverting 3-State bus-compatible outputs in both send and receive directions. The outputs are capable of sinking 64mA and sourcing up to 15mA, providing very good capacitive drive characteristics. The 'F620 is an inverting version of the 'F623.

These octal bus transceivers are designed for asynchronous two-way communication between data buses. The control function implementation allows for maximum flexibility in timing.

These devices allow data transmisstion from the A bus to the B bus or from the B bus to the A bus, depending upon the logic levels at the Enable inputs ($\overline{\text{G}}$BA and GAB). The Enable inputs can be used to disable the device so that the buses are effectively isolated.

The dual-enable configuration gives the 'F620 and 'F623 the capability to store data by simultaneous enabling of $\overline{\text{G}}$BA and GAB. Each output reinforces its input in this transceiver configuration. Thus, when both control inputs are enabled and all other data sources to the two sets of the bus lines are at high impedance, both sets of bus lines (16 in all) will remain at their last states.

FUNCTION TABLE

ENABLE	INPUTS	OPERATION	
$\overline{\text{G}}$BA	GAB	'F620	'F623
L	L	$\overline{\text{B}}$ data to A bus	B data to A bus
H	H	$\overline{\text{A}}$ data to B bus	A data to B bus
H	L	(Z)	(Z)
L	H	$\overline{\text{B}}$ data to A bus, $\overline{\text{A}}$ data to B bus	B data to A bus, A data to B bus

H = HIGH voltage level
L = LOW voltage level
(Z) = HIGH impedance (off) state

ABSOLUTE MAXIMUM RATINGS

(Operation beyond the limits set forth in this table may impair the useful life of the device. Unless otherwise noted these limits are over the operating free-air temperature range.)

FAST 74F657
Transceiver

Octal Bidirectional Transceiver With 8-Bit Parity Generator/Checker (3-State Outputs)
Product Specification

Logic Products

FEATURES

- **High-impedance NPN base input for reduced loading (20μA in HIGH and LOW states)**
- **Ideal in application where high output drive and light bus loading are required (I_{IL} is 20μA Vs FAST std of 6000μA)**
- **24-pin plastic slim dip (300-mil) package**
- **Combines 'F245 and 'F280A functions in one package**
- **3-State outputs**
- **Outputs sink 64mA**
- **15mA source current**
- **Input diodes for termination effects**

DESCRIPTION

The 'F657 contains eight non-inverting buffers with 3-State outputs and an 8-bit parity generator/checker, and is intended for bus-oriented applications. The buffers have a guaranteed current sinking capability of 20mA at the A ports and 64mA at the B ports. The Transmit/Receive (T/$\overline{R}$) input determines the direction of the data flow through the bidirectional transceivers. Transmit (active HIGH) enables data from A ports to B ports; Receive (active LOW) enables data from B ports to A ports.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74F657	5ns	120mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE $V_{CC} = 5V \pm 10\%$; $T_A = 0°C$ to $+70°C$
Plastic DIP	N74F657N
Plastic SOL-24	N74F657D

NOTES:
1. SO package is surface-mounted micro-miniature DIP.
2. For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74F(U.L.) HIGH/LOW	LOAD VALUE HIGH/LOW
$A_0 - A_7$	A ports 3-State inputs	5.0/0.167	100μA/100μA

Autodirectional Bus Transceiver 8X41

DESIGN FEATURES

- **Intelligent bidirectional bus repeater with self-generating or external control**
- **Eight independent channels**
- **Open-collector outputs (meets DEC UNIBUS* specifications)**
- **TTL compatible**
- **High speed (30-nanoseconds max)**
- **Expandable to any number of bits**
- **High input impedance for every operating value of V_{CC}**
- **Low input current (less than 100-microamperes); high output current (up to 70-milliamperes)**
- **0.6 in. 24-pin DIP**
- **+5V supply**

USE AND APPLICATION

- **Minicomputers**
- **Microcomputers MOS/Bipolar**
- **Communications**
- **Signal buffer**
- **Bus fan-out extensions**
- **Distributed processing**
- **Bidirectional bus connector/isolator**

PRODUCT DESCRIPTION

The Signetics 8X41 Autodirectional Bus Transceiver is a general purpose asynchronous device ideal for system bus expansion applications. The 8X41 consists of eight data channels, each with one pair of terminals (A_i and B_i); each data channel can be operated independently.

The device requires no external controls since all intelligence is internally generated; thus, operation of the device is completely autonomous. The first logic low signal that occurs on one channel terminal (A_i or B_i) will be repeated on the corresponding terminal (B_i or A_i) of the same channel.

The 8X41 is designed for use in open-collector bus systems where high speed and low-current inputs/high-current outputs are required. In system configurations, the discrete capabilities of the bus transceiver can be expanded by parallel connection to service any number of bits. To provide reliable operation and integrity of data transfers, all channels are disabled by an on-chip power monitor whenever V_{CC} falls below approximately 4V.

FUNCTIONAL OPERATION

The 8X41 (Figure 1) consists of eight functionally independent yet logically identical channels. Each channel consists of two bus terminals (A_i and B_i); each terminal is internally connected to an open-collector driver and a high-impedance receiver. The monitoring state of each channel is defined when both terminals (A_i and B_i) are "high"; in this state, the internal logic of the 8X41 continually examines the A and B bus signals to determine signal direction—A_i to B_i or B_i to A_i. A low signal occurring at either of the two terminals causes the open-collector driver on the opposite terminal to follow suit; hence, the signal is repeated by the 8X41. For each channel, latches L1 and L2 determine signal direction. As shown in the truth table for these latches, there is no transmission of data when both signals are low; however, this condition should never occur during normal system operation.

The internal automatic direction control can be overridden by either or both of the common disable inputs—$\overline{DBA}$ and $\overline{DAB}$. When $\overline{DBA}$ is driven low ($\overline{DAB}$ = high), the B_i to A_i path is interrupted and the device becomes a unidirectional repeater in the A_i to B_i direction only. With these conditions reversed ($\overline{DAB}$ = low and $\overline{DBA}$ = high), the A_i to B_i path is interrupted and the chip functions as a unidirectional repeater in the B_i to A_i direction. When both control signals are low, data passage is inhibited in both directions. Refer to the I/O truth table for all possible input/output conditions.

CMOS 4000B Family Characteristics

ABSOLUTE MAXIMUM RATINGS

SYMBOL AND PARAMETER		RATING	UNIT
V_{DD}	Supply voltage	−0.5 to +18	V
V_I	Voltage on any input	−0.5 to V_{DD} +0.5V	V
±I	Current into any input or output	10	mA
T_{stg}	Storage temperature	−65 to +150	°C
T_{amb}	Operating ambient temperature	−40 to +85	°C

AC ELECTRICAL CHARACTERISTICS

Clock input rise and fall times (t_r, t_f)

The upper limits on t_r and t_f vary widely from device to device and with supply voltage. Unless otherwise specified in the individual data sheets it is recommended that input rise and fall times be less than 15 μs for V_{DD} = 5 V; 4 μs for V_{DD} = 10 V; 1 μs for V_{DD} = 15 V.

Output transition times (t_{TLH}, t_{THL})

V_{SS} = 0 V; T_{amb} = 25°C; C_L = 50 pF; input transition times ≤ 20 ns

SYMBOL AND PARAMETER		TEST CONDITION	Min	Typ	Max	UNIT
t_{THL}	Output transition time HIGH to LOW	V_{DD} = 5V, 10_{ns} + (1.0 ns/pF) C_L		60	120	ns
		V_{DD} = 10V, 9_{ns} + (0.42 ns/pF) C_L		30	60	
		V_{DD} = 15 V, 6_{ns} + (0.28 ns/pF) C_L		20	40	
t_{TLH}	Output transition time HIGH to LOW	V_{DD} = 5V, 10_{ns} + (1.0 ns/pF) C_L		60	120	ns
		V_{DD} = 10V, 9_{ns} + (0.42 ns/pF) C_L		30	60	
		V_{DD} = 15 V, 6_{ns} + (0.28 ns/pF) C_L		20	40	

Temperature coefficient (typical values)

Propagation delays	+0.35%/°C
Output transition times	+0.35%/°C

Input capacitance (digital inputs)
Maximum input capacitance C_I = 7.5 pF.

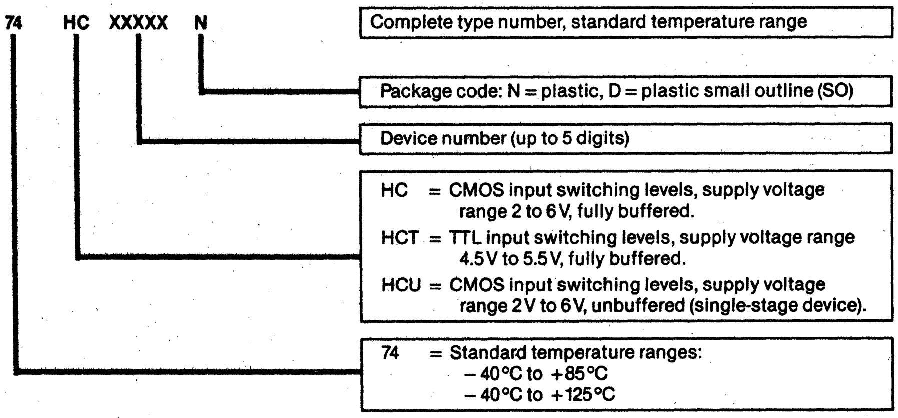
Type Number Designations



74 HC XXXXX N

Complete type number, standard temperature range

Package code: N = plastic, D = plastic small outline (SO)

Device number (up to 5 digits)

HC = CMOS input switching levels, supply voltage range 2 to 6V, fully buffered.
HCT = TTL input switching levels, supply voltage range 4.5V to 5.5V, fully buffered.
HCU = CMOS input switching levels, supply voltage range 2V to 6V, unbuffered (single-stage device).

74 = Standard temperature ranges:
−40°C to +85°C
−40°C to +125°C

High-Speed CMOS Family Characteristics

AC characteristics for 74HC

GND = 0V; $t_r = t_f = 6$ns; $C_L = 50$pF

Symbol	Parameter	T_{amb} (°C)							Unit	Test Conditions
		74HC								V_{CC} V
		+25			−40 to +85		−40 to +125			
		min.	typ.	max.	min.	max.	min.	max.		
t_{THL} / t_{TLH}	Output transition time standard outputs			75 15 13		95 19 16		110 22 19	ns	2.0 4.5 6.0
t_{THL} / t_{TLH}	Output transition time bus driver outputs			60 12 10		75 15 13		90 18 15	ns	2.0 4.5 6.0

AC characteristics for 74HCU

GND = 0V; $t_r = t_f = 6$ns; $C_L = 50$pF

Symbol	Parameter	T_{amb} (°C)							Unit	Test Conditions
		74HCU								V_{CC} V

T_{amb}	operating ambient temperature range	−40		+85	−40		+85	°C	
T_{amb}	operating ambient temperature range	−40		+125	−40		+125	°C	
t_r, t_f	Input rise and fall times except for Schmitt-trigger inputs and HCU devices		6.0	1000 500 400		6.0	500	ns	$V_{CC} = 2.0$V $V_{CC} = 4.5$V $V_{CC} = 6.0$V

High-Speed CMOS Family Characteristics

DC characteristics for 74HCT

Voltages are referenced to GND (ground = 0 V)

Symbol	Parameter	T_{amb} (°C)							Unit	Test Conditions		
		74HCT								V_{CC} V	V_I	Other
		+25			−40 to +85		−40 to +125					
		min.	typ.	max.	min.	max.	min.	max.				
V_{IH}	HIGH level input voltage	2.0			2.0		2.0		V	4.5 to 5.5		
V_{IL}	LOW level input voltage			0.8		0.8		0.8	V	4.5 to 5.5		
V_{OH}	HIGH level output voltage all outputs	4.4	4.5		4.4		4.4		V	4.5	V_{IH} or V_{IL}	$-I_O = 20\mu A$
V_{OH}	HIGH level output voltage standard outputs	3.98			3.84		3.7		V	4.5	V_{IH} or V_{IL}	$-I_O = 4.0 mA$
V_{OH}	HIGH level output voltage bus driver outputs	3.98			3.84		3.7		V	4.5	V_{IH} or V_{IL}	$-I_O = 6.0 mA$
V_{OL}	LOW level output voltage all outputs		0	0.1		0.1		0.1	V	4.5	V_{IH} or V_{IL}	$I_O = 20\mu A$
V_{OL}	LOW level output voltage standard outputs			0.26		0.33		0.4	V	4.5	V_{IH} or V_{IL}	$I_O = 4.0 mA$
V_{OL}	LOW level output voltage bus driver outputs			0.26		0.33		0.4	V	4.5	V_{IH} or V_{IL}	$I_O = 6.0 mA$
$\pm I_I$	input leakage current			0.1		1.0		1.0	μA	5.5	V_{IH} or V_{IL}	
$\pm I_S$	Analog switch OFF-state current per channel			0.1		1.0		1.0	μA	5.5	V_{IH} or V_{IL}	$\lvert V_S \rvert = V_{CC}$ (Note 1)
$\pm I_S$	Analog switch ON-state leakage current			0.2		2.0		2.0	μA	5.5	V_{IH} or V_{IL}	$\lvert V_S \rvert = V_{CC}$ (Note 1)
$\pm I_{OZ}$	3-state OFF-state current			0.5		5.0		10.0	μA	5.5	V_{IH} or V_{IL}	$V_O = V_{CC}$ or GND per input pin; other inputs at V_{CC} or GND; $I_O = 0$
I_{CC}	Quiescent supply current SSI flip-flops MSI			 2.0 4.0 8.0		 20.0 40.0 80.0		 40.0 80.0 160.0	 μA μA μA	 6.0 6.0 6.0	V_{CC} or GND	 $I_O = 0$ $I_O = 0$ $I_O = 0$
ΔI_{CC}	Additional quiescent supply current per input pin for unit load coefficient is 1 (Note 2)		100	360		450		490	μA	4.5 to 5.5	V_{CC} −2.1V	Other inputs at V_{CC} or GND; $I_O = 0$

Notes

1. If applicable V_{EE} = GND.
2. The additional quiescent supply current per input is determined by the ΔI_{CC} unit load, which has to be multiplied by the unit load coefficient as given in the individual data sheets. For dual supply systems the theoretical worst-case (V_I = 2.4 V; V_{CC} = 5.5 V) specification is: ΔI_{CC} = 0.65 mA (typical) and 1.8 mA (maximum) across temperature.

High-Speed CMOS Family Characteristics

What is HCMOS?

Manufacturing processes for such complex single-chip integrated circuits as microcomputers and large-capacity memories have been so refined that these circuits are now faster and/or less power-consuming than the CMOS and LSTTL circuits available to interconnect them. This anomaly severely restricts achievable overall system performance and highlights the vital importance of a continuing development program such as that at Signetics, to reduce the power consumption and increase the speed of logic circuit elements.

In the 1970's a self-aligning 6-micron (and, later, 4-micron) polycrystalline silicon-gate CMOS process was used with an isolated-oxide technique to manufacture the HE4000B family. These silicon-gate P-well CMOS circuits were nearly three times as fast as the then available metal-gate CMOS circuits, yet consumed only about 65% of the dynamic power.

For its new high-speed CMOS (HCMOS) family of logic integrated circuits, Signetics has used the same proven CMOS manufacturing facilities and process, but with tighter layout rules, a 3-micron gate structure, and thinner oxide in the gate region (figure 1). This enhancement of the CMOS process results in a further fivefold speed increase (figure 2) and

High-Speed CMOS Family Characteristics

a tenfold increase of drive capability without increasing power consumption (figure 3 and 4).

Among the outstanding features made possible by the HCMOS process are:

- Low power consumption
  - — Less than 0.5mW dc
  - — Typically 1mW at 1MHz ac
- LSTTL switching speed
  - — Typical propagation delay for gates: 10ns
  - — Typical propagation delay for latches: 15ns
  - — Typical propagation delay for flip-flops: 20ns
  - — Typical operating frequency (with V_{CC} at 4.5V and ambient temperature at 25°C): 60MHz
- Symmetrical output rise and fall times
- Symmetrical sourcing and sinking currents
- 30%-70% DC noise margin (HC-type parts)
- CMOS-compatible input switching levels (HC-type parts)
- LSTTL input switching levels (HCT-type parts)
- Standard outputs fan out to 10 LSTTL loads (4mA).
- Bus outputs fan out to 15 LSTTL loads (6mA).
- Wide range of operating supply voltages
  - — From 2V to 6V for HC-type parts
  - — 5V ± 10% for HCT-type parts
- Analog switches operating up to 10V
- Wide operating temperature range (−40°C to +85°C and −40°C to +125°C)
- Immunity to electrostatic discharge better than 2000V
- Latch-up free operation
- Available in plastic dual in-line or small outline (SMD) packages.
- Meets Jedec standard #7
- Alternate source to RCA.

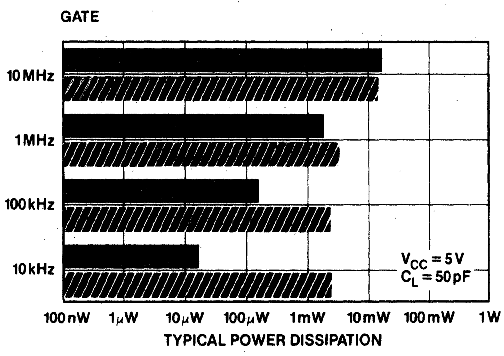

Figure 4 **Comparison of typical HCMOS and LSTTL dynamic power dissipation as a function of frequency for a single flip-flop**

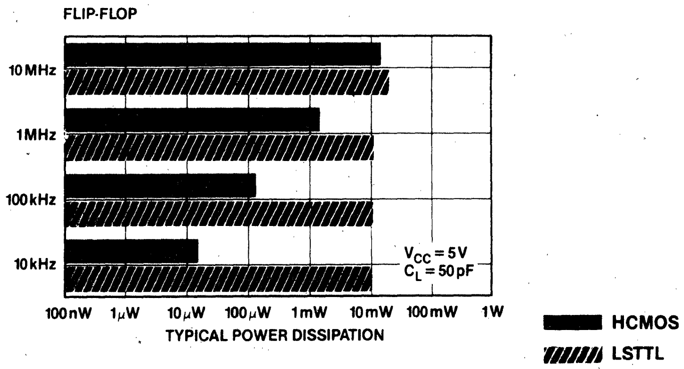


High-Speed CMOS Family Characteristics

The 74HC and 74HCT families

The 74HC and 74HCT families of HCMOS circuits have the low power consumption, high input noise immunity, and wide operating temperature range of earlier silicon-gate CMOS, combined with the high speed and drive capability previously attainable only with bipolar LSTTL. In new CMOS system designs, they eliminate the need to compromise between speed and power consumption and allow optimization of performance. In existing design, HCMOS circuits can directly replace some or all of the logic elements from other families, both CMOS and bipolar LSTTL, without interfacing problems. This can considerably reduce costs by simplifying power supply and cooling requirements, allowing higher packing density, increasing reliability, and extending the operating life of equipment.

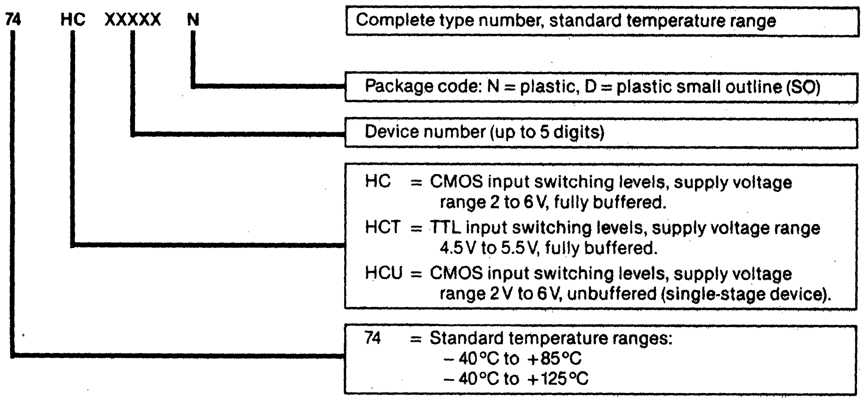
The HCMOS family is comprised of 140 circuits, the majority of which are available in two versions.

Circuits of the 74HC type are fully buffered, with CMOS input switching levels for high noise immunity, typical gate operating current of 3μA at 10kHz, negligible quiescent supply and input current, and typical gate propagation delay of from 9ns to 11.5ns (with a capacitive load of from 15pF to 100pF); they operate from a supply of from 2V to 6V. The main role of the 74HC family is as faster CMOS replacements for new designs.

Circuits of the 74HCT type are also fully buffered, with the same features and functions as the 74HC types, but have TTL input switching levels, operate from a supply voltage 5V ± 10%, and are pin-compatible with most popular LSTTL circuits. Their main role is replacing LSTTL circuits to reduce power consumption without reducing speed.

An unbuffered inverter, the 74HCU04, is also available for implementing RC or crystal oscillators and other feedback circuits operating in the linear mode.

Type Number Designations



Complete type number, standard temperature range

Package code: N = plastic, D = plastic small outline (SO)

Device number (up to 5 digits)

HC = CMOS input switching levels, supply voltage range 2 to 6V, fully buffered.
HCT = TTL input switching levels, supply voltage range 4.5V to 5.5V, fully buffered.
HCU = CMOS input switching levels, supply voltage range 2V to 6V, unbuffered (single-stage device).

74 = Standard temperature ranges:
− 40°C to +85°C
− 40°C to +125°C

description

These 64-bit memories use Advanced Low-Power Schottky technology and feature high speed and fast fall-through times. They are organized as 16 words by 4 bits each.

A FIFO memory is a storage device that allows data to be written into and read from its array at independent data rates. These FIFOs are designed to process data at rates from 0 to 25 megahertz in a bit-parallel format, word by word.

Data is written into memory on a low-to-high transition at the load clock input (LDCK) and is read out on a low-to-high transition at the unload clock input (UNCK). The memory is full when the number of words clocked in exceeds by 16 the number of words clocked out. When the memory is full, LDCK signals have no effect on the data residing in memory. When the memory is empty, UNCK signals have no effect.

Status of the FIFO memory is monitored by the $\overline{\mathrm{FULL}}$ and $\overline{\mathrm{EMPTY}}$ output flags. The $\overline{\mathrm{FULL}}$ output will be low when the memory is full, and high when the memory is not full. The $\overline{\mathrm{EMPTY}}$ output will be low when the memory is empty, and high when it is not empty.

A low level on the reset input ($\overline{\mathrm{RST}}$) resets the internal stack control pointers and also sets $\overline{\mathrm{EMPTY}}$ low and sets $\overline{\mathrm{FULL}}$ high. The outputs are not reset to any specific logic levels. The first low-to-high transition on LDCK, either after a $\overline{\mathrm{RST}}$ pulse or from an empty condition, will cause $\overline{\mathrm{EMPTY}}$ to go high and the data to appear on the Q outputs. It is important to note that the first word does not have to be unloaded. Data outputs are noninverting with respect to the data inputs and are at high impedance when the output-enable input (OE) is low. OE does not affect either the $\overline{\mathrm{FULL}}$ or $\overline{\mathrm{EMPTY}}$ output flags. Cascading is easily accomplished in the word-width direction, but is not possible in the word-depth direction.

PRODUCT PREVIEW documents contain information on products in the formative or design phase of development. Characteristic data and other specifications are design goals. Texas Instruments reserves the right to change or discontinue these products without notice.

†This symbol is in accordance with ANSI/IEEE Standard 91-1984 and IEC Publication 617-12. The symbol is functionally accurate but does not show the details of implementation; for these, see the logic diagram. The symbol represents the memory as if it were controlled by a single counter whose content is the number of words stored at the time. Output data is invalid when the counter content (CT) is 0.

description

These 64-bit memories utilize Advanced Low-Power Schottky technology and feature high speed and fast fall-through times. They are organized as 16 words by 5 bits each.

A FIFO memory is a storage device that allows data to be written into and read from its array at independent data rates. These FIFOs are designed to process data at rates from 0 to 25 megahertz in a bit-parallel format, word by word.

Data is written into memory on a low-to-high transition at the load clock input (LDCK) and is read out on a low-to-high transition at the unload clock input (UNCK). The memory is full when the number of words clocked in exceeds by 16 the number of words clocked out. When the memory is full, LDCK signals will have no effect. When the memory is empty, UNCK signals have no effect.

Status of the FIFO memory is monitored by the $\overline{\text{FULL}}$, $\overline{\text{EMPTY}}$, $\overline{\text{FULL}-1}$, and $\overline{\text{EMPTY}+1}$ output flags. The FULL output will be low whenever the memory is full, and high whenever not full. The $\overline{\text{FULL}-1}$ output will be low whenever the memory contains 15 data words. The $\overline{\text{EMPTY}}$ output will be low whenever the memory is empty, and high whenever it is not empty. The $\overline{\text{EMPTY}+1}$ output will be low whenever one word remains in memory.

A low level on the reset input ($\overline{\text{RST}}$) resets the internal stack control pointers and also sets $\overline{\text{EMPTY}}$ low and sets $\overline{\text{FULL}}$, $\overline{\text{FULL}-1}$, and $\overline{\text{EMPTY}+1}$ high. The Q outputs are not reset to any specific logic level. The first low-to-high transition on LDCK, after either a $\overline{\text{RST}}$ pulse or from an empty condition, will cause $\overline{\text{EMPTY}}$ to go high and the data to appear on the Q outputs. It is important to note that the first word does not have to be unloaded. Data outputs are noninverting with respect to the data inputs and are at high impedance when the output enable input (OE) is low. OE does not affect the output flags. Cascading is easily accomplished in the word-width direction, but is not possible in the word-depth direction.

'ALS617	Open-Collector

description

The 'ALS616 and 'ALS617 are 16-bit parallel error detection and correction circuits in 40-pin, 600-mil packages. The EDACs use a modified Hamming code to generate a 6-bit check word from a 16-bit data word. This check word is stored along with the data word during the memory write cycle. During memory read cycles, the 22-bit words from memory are processed by the EDACs to determine if errors have occurred in memory.

Single-bit errors in the 16-bit data word are flagged and corrected. Single-bit errors in the 6-bit check word are flagged, but the data word will remain unaltered. The 6-bit error syndrome code will pinpoint the error-generating location.

Dual-bit errors are flagged but not corrected. These errors may occur in any two bits of the 22-bit word from memory. The gross-error condition of all lows or all highs from memory will be detected. Otherwise, errors in three or more bits of the 22-bit word are beyond the capabilities of these devices to detect.

Read-modify-write (byte-control) operations can be performed with the 'ALS616 and 'ALS617 EDACs by using output latch enable, $\overline{\text{LEDBO}}$, and individual $\overline{\text{OEB0}}$ and $\overline{\text{OEB1}}$ byte control pins.

Diagnostics are performed on the EDACs by controls and internal paths that allow the user to read the contents of the DB and CB input latches. These will determine if the failure occurred in memory or in the EDAC.

TABLE 1. WRITE CONTROL FUNCTION

MEMORY CYCLE	EDAC FUNCTION	CONTROL S1 S0	DATA I/O	DB CONTROL $\overline{OEB0}$ & $\overline{OEB1}$	DB OUTPUT LATCH $\overline{LEDBO}$	CHECK I/O	CB CONTROL $\overline{OECB}$	ERROR FLAGS $\overline{ERR}$ $\overline{MERR}$
Write	Generate check word	L L	Input	H	X	Output check bits†	L	H H

†See Table 2 for details on check bit generation.

memory write cycle details

During a memory write cycle, the check bits (CB0 thru CB5) are generated internally in the EDAC by six 8-input parity generators using the 16-bit data word as defined in Table 2. These six check bits are stored in memory along with the original 16-bit data word. This 22-bit word will later be used in the memory read cycle for error detection and correction.

TABLE 2. PARITY ALGORITHM

CHECK WORD	16-BIT DATA WORD															
BIT	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CB0			X		X	X	X			X			X		X	X
CB1		X		X		X	X	X				X		X		X
CB2	X			X	X			X	X		X			X	X	
CB3	X	X	X				X	X			X	X	X			
CB4	X	X	X	X	X	X			X	X						
CB5									X	X	X	X	X	X	X	X

The six check bits are parity bits derived from the matrix of data bits as indicated by "X" for each bit.

error detection and correction details

During a memory read cycle, the 6-bit check word is retrieved along with the actual data. In order to be able to determine whether the data from memory is acceptable to use as presented to the bus, the error flags must be tested to determine if they are at the high level.

The first case in Table 3 represents the normal, no-error conditions. The EDAC presents highs on both flags. The next two cases of single-bit errors give a high on $\overline{MERR}$ and a low on $\overline{ERR}$, which is the signal for a correctable error, and the EDAC should be sent through the correction cycle. The last three cases of double-bit errors will cause the EDAC to signal lows on both $\overline{ERR}$ and $\overline{MERR}$, which is the interrupt indication for the CPU.

TABLE 3. ERROR FUNCTION

TOTAL NUMBER OF ERRORS		ERROR FLAGS		DATA CORRECTION
16-BIT DATA WORD	6-BIT CHECK WORD	$\overline{ERR}$	$\overline{MERR}$	
0	0	H	H	Not applicable
1	0	L	H	Correction
0	1	L	H	Correction
1	1	L	L	Interrupt
2	0	L	L	Interrupt
0	2	L	L	Interrupt

TABLE 4. READ, FLAG, AND CORRECT FUNCTION

MEMORY CYCLE	EDAC FUNCTION	CONTROL S1	CONTROL S0	DATA I/O	DB CONTROL $\overline{OEB0}$ & $\overline{OEB1}$	DB OUTPUT LATCH $\overline{LEDBO}$	CHECK I/O	CB CONTROL $\overline{OECB}$	ERROR FLAGS $\overline{ERR}$ $\overline{MERR}$
Read	Read & flag	H	L	Input	H	X	Input	H	Enabled†
Read	Latch input data & check bits	H	H	Latched input data	H	L	Latched input check word	H	Enabled†
Read	Output corrected data and syndrome bits	H	H	Output corrected data word	L	X	Output syndrome bits‡	L	Enabled†

†See Table 3 for error description.
‡See Table 5 for error location.

Error detection is accomplished as the 6-bit check word and the 16-bit data word from memory are applied to the internal parity generators/checkers. If the parity of all six groupings of data and check bits are correct, it is assumed that no error has occurred and both error flags will be high.

If the parity of one or more of the check groups is incorrect, an error has occurred and the proper error flag or flags will be set low. The two-bit error is not correctable since the parity tree can only identify single-bit errors. Both error flags are set low when any two-bit error is detected.

Three or more simultaneous bit errors can cause the EDAC to believe that no error, a correctable error, or an uncorrectable error has occurred and will produce erroneous results in all three cases. It should be noted that the gross-error conditions of all highs will be detected.

As the corrected word is made available on the data I/O port (DB0 thru DB15), the check word I/O port (CB0 thru CB5) presents a 6-bit syndrome error code. This syndrome code can be used to locate the bad memory chip. See Table 5 for syndrome decoding.

read-modify-write (byte control) operations

The 'ALS616 and 'ALS617 devices are capable of byte-write operations. The 22-bit word from memory must first be latched into the DB and CB input latches. This is easily accomplished by switching from the read and flag mode (S1 = H, S0 = L) to the latch input mode (S1 = H, S0 = H). The EDAC will then make any corrections, if necessary, to the data word and place it at the input of the output data latch. This data word must then be latched into the output data latch by taking $\overline{\text{LEDB0}}$ from a low to a high.

Byte control can now be employed on the data word through the $\overline{\text{OEB0}}$ or $\overline{\text{OEB1}}$ controls. $\overline{\text{OEB0}}$ controls DB0-DB7 (byte 0), $\overline{\text{OEB1}}$ controls DB8-DB15 (byte 1).

Placing a high on the byte control will disable the output and the user can modify the byte. If a low is placed on the byte control, then the original byte is allowed to pass onto the data bus unchanged. If the original data word is altered through byte control, a new check word must be generated before it is written back into memory. This is easily accomplished by taking control S1 and S0 low. Table 6 lists the read-modify-write functions.

TABLE 6. READ-MODIFY-WRITE FUNCTION

diagnostic operations

The 'ALS616 and 'ALS617 are capable of diagnostics that allow the user to determine whether the EDAC or the memory is failing. The diagnostic function tables will help the user to see the possibilities for diagnostic control.

In the diagnostic mode (S1 = L, S0 = H), the checkword is latched into the input latch while the data input latch remains transparent. This lets the user apply various data words against a fixed known checkword. If the user applies a diagnostic data word with an error in any bit location, the $\overline{\text{ERR}}$ flag should be low. If a diagnostic data word with two errors in any bit location is applied, the $\overline{\text{MERR}}$ flag should be low. After the checkword is latched into the input latch, it can be verified by taking $\overline{\text{OECB}}$ low. This outputs the latched checkword. The diagnostic data word can be latched into the output data latch and verified via the $\overline{\text{LEDBO}}$ control pin. By changing from the diagnostic mode (S1 = L, S0 = H), the user can verify that the EDAC will correct the diagnostic data word. Also, the syndrome bits can be produced to verify that the EDAC pinpoints the error location. Table 7 lists the diagnostic functions.

TABLE 7. DIAGNOSTIC FUNCTION

EDAC FUNCTION	CONTROL S1 S0	DATA I/O	DB BYTE CONTROL $\overline{\text{OEB}n}$	DB OUTPUT LATCH $\overline{\text{LEDBO}}$	CHECK I/O	CB CONTROL $\overline{\text{OECB}}$	ERROR FLAGS $\overline{\text{ERR}}$ $\overline{\text{MERR}}$

					Hi-Z	H	

†Diagnostic data is a data word with an error in one bit location except when testing the $\overline{\text{MERR}}$ error flag. In this case, the diagnostic data word will contain errors in two bit locations.

description

The 'ALS632A and 'ALS633 through 'ALS635 devices are 32-bit parallel error detection and correction circuits (EDACs) in 52-pin ('ALS632A and 'ALS633) or 48-pin ('ALS634 and 'ALS635) 600-mil packages. The EDACs use a modified Hamming code to generate a 7-bit check word from a 32-bit data word. This check word is stored along with the data word during the memory write cycle. During the memory read cycle, the 39-bit words from memory are processed by the EDACs to determine if errors have occurred in memory.

Single-bit errors in the 32-bit data word are flagged and corrected.

Single-bit errors in the 7-bit check word are flagged, and the CPU sends the EDAC through the correction cycle even though the 32-bit data word is not in error. The correction cycle will simply pass along the original 32-bit data word in this case and produce error syndrome bits to pinpoint the error-generating location.

Dual-bit errors are flagged but not corrected. These errors may occur in any two bits of the 39-bit data word from memory (two errors in the 32-bit data word, two errors in the 7-bit check word, or one error in each word). The gross-error condition of all lows or all highs from memory will be detected. Otherwise, errors in three or more bits of the 39-bit word are beyond the capabilities of these devices to detect.

TEXAS INSTRUMENTS
POST OFFICE BOX 225012 • DALLAS, TEXAS 75265

Read-modify-write (byte-control) operations can be performed with the 'ALS632A and 'ALS633 EDACs by using output latch enable, $\overline{\text{LEDBO}}$, and the individual $\overline{\text{OEB0}}$ thru $\overline{\text{OEB3}}$ byte control pins.

Diagnostics are performed on the EDACs by controls and internal paths that allow the user to read the contents of the DB and CB input latches. These will determine if the failure occurred in memory or in the EDAC.

TABLE 1. WRITE CONTROL FUNCTION

MEMORY CYCLE	EDAC FUNCTION	CONTROL S1	CONTROL S0	DATA I/O	DB CONTROL $\overline{\text{OEBn}}$ OR $\overline{\text{OEDB}}$	DB OUTPUT LATCH ('ALS632A, 'ALS633) $\overline{\text{LEDBO}}$	CHECK I/O	CB CONTROL $\overline{\text{OECB}}$	ERROR FLAGS $\overline{\text{ERR}}$	ERROR FLAGS $\overline{\text{MERR}}$
Write	Generate check word	L	L	Input	H	X	Output check bits†	L	H	H

†See Table 2 for details on check bit generation.

memory write cycle details

During a memory write cycle, the check bits (CB0 thru CB6) are generated internally in the EDAC by seven 16-input parity generators using the 32-bit data word as defined in Table 2. These seven check bits are stored in memory along with the original 32-bit data word. This 32-bit word will later be used in the memory read cycle for error detection and correction.

TABLE 2. PARITY ALGORITHM

CHECK WORD	32-BIT DATA WORD																															
BIT	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CB0	X		X	X		X					X		X	X	X			X			X		X	X	X	X		X				X
CB1				X		X		X		X		X		X	X	X				X		X		X		X		X		X	X	X
CB2	X		X			X	X		X			X	X			X	X		X			X	X		X			X	X			X
CB3			X	X	X				X	X	X				X	X			X	X	X				X	X	X				X	X
CB4	X	X							X	X	X	X	X	X			X	X							X	X	X	X	X	X		
CB5	X	X	X	X	X	X	X	X									X	X	X	X	X	X	X	X								
CB6	X	X	X	X	X	X	X	X																	X	X	X	X	X	X	X	X

The seven check bits are parity bits derived from the matrix of data bits as indicated by "X" for each bit.

error detection and correction details

During a memory read cycle, the 7-bit check word is retrieved along with the actual data. In order to be able to determine whether the data from memory is acceptable to use as presented to the bus, the error flags must be tested to determine if they are at the high level.

The first case in Table 3 represents the normal, no-error conditions. The EDAC presents highs on both flags. The next two cases of single-bit errors give a high on $\overline{\text{MERR}}$ and a low on $\overline{\text{ERR}}$, which is the signal for a correctable error, and the EDAC should be sent through the correction cycle. The last three cases of double-bit errors will cause the EDAC to signal lows on both $\overline{\text{ERR}}$ and $\overline{\text{MERR}}$, which is the interrupt indication for the CPU.

TABLE 3. ERROR FUNCTION

TOTAL NUMBER OF ERRORS		ERROR FLAGS		DATA CORRECTION
32-BIT DATA WORD	7-BIT CHECK WORD	$\overline{\text{ERR}}$	$\overline{\text{MERR}}$	
0	0	H	H	Not applicable
1	0	L	H	Correction
0	1	L	H	Correction
1	1	L	L	Interrupt
2	0	L	L	Interrupt
0	2	L	L	Interrupt

Error detection is accomplished as the 7-bit check word and the 32-bit data word from memory are applied to internal parity generators/checkers. If the parity of all seven groupings of data and check bits are correct, it is assumed that no error has occurred and both error flags will be high.

If the parity of one or more of the check groups is incorrect, an error has occurred and the proper error flag or flags will be set low. Any single error in the 32-bit data word will change the state of either three or five bits of the 7-bit check word. Any single error in the 7-bit check word changes the state of only that one bit. In either case, the single error flag ($\overline{\text{ERR}}$) will be set low while the dual error flag ($\overline{\text{MERR}}$) will remain high.

Any two-bit error will change the state of an even number of check bits. The two-bit error is not correctable since the parity tree can only identify single-bit errors. Both error flags are set low when any two-bit error is detected.

Three or more simultaneous bit errors can cause the EDAC to believe that no error, a correctable error, or an uncorrectable error has occurred and will produce erroneous results in all three cases. It should be noted that the gross-error conditions of all lows and all highs will be detected.

TABLE 4. READ, FLAG, AND CORRECT FUNCTION

MEMORY CYCLE	EDAC FUNCTION	CONTROL S1	CONTROL S0	DATA I/O	DB CONTROL $\overline{\text{OEB}}$n OR $\overline{\text{OEDB}}$	DB OUTPUT LATCH ('ALS632A, 'ALS633) $\overline{\text{LEDBO}}$	CHECK I/O	CB CONTROL $\overline{\text{OECB}}$	ERROR FLAGS $\overline{\text{ERR}}$ $\overline{\text{MERR}}$
Read	Read & flag	H	L	Input	H	X	Input	H	Enabled†
Read	Latch input data & check bits	H	H	Latched input data	H	L	Latched input check word	H	Enabled†
Read	Output corrected data & syndrome bits	H	H	Output corrected data word	L	X	Output syndrome bits‡	L	Enabled†

†See Table 3 for error description.
‡See Table 5 for error location.

As the corrected word is made available on the data I/O port (DB0 thru DB31), the check word I/O port (CB0 thru CB6) presents a 7-bit syndrome error code. This syndrome error code can be used to locate the bad memory chip. See Table 5 for syndrome decoding.

TABLE 5. SYNDROME DECODING

read-modify-write (byte control) operations

The 'ALS632A and 'ALS633 devices are capable of byte-write operations. The 39-bit word from memory must first be latched into the DB and CB input latches. This is easily accomplished by switching from the read and flag mode (S1 = H, S0 = L) to the latch input mode (S1 = H, S0 = H). The EDAC will then make any corrections, if necessary, to the data word and place it at the input of the output data latch. This data word must then be latched into the output data latch by taking $\overline{\text{LEDBO}}$ from a low to a high.

Byte control can now be employed on the data word through the $\overline{\text{OEB0}}$ through $\overline{\text{OEB3}}$ controls. $\overline{\text{OEB0}}$ controls DB0-DB7 (byte 0), $\overline{\text{OEB1}}$ controls DB8-DB15 (byte 1), $\overline{\text{OEB2}}$ controls DB16-DB23 (byte 2), and $\overline{\text{OEB3}}$ controls DB24-DB31 (byte 3). Placing a high on the byte control will disable the output and the user can modify the byte. If a low is placed on the byte control, then the original byte is allowed to pass onto the data bus unchanged. If the original data word is altered through byte control, a new check word must be generated before it is written back into memory. This is easily accomplished by taking control S1 and S0 low. Table 6 lists the read-modify-write functions.

TEXAS INSTRUMENTS
POST OFFICE BOX 225012 • DALLAS, TEXAS 75265

				Output unchanged BYTE0	L					

†$\overline{\text{OEB}}$0 controls DB0-DB7 (BYTE0), $\overline{\text{OEB}}$1 controls DB8-DB15 (BYTE1), $\overline{\text{OEB}}$3 controls DB16-DB23 (BYTE2), $\overline{\text{OEB}}$3 controls DB24-DB31 (BYTE3).

diagnostic operations

The 'ALS632A and 'ALS633 thru 'ALS635 are capable of diagnostics that allow the user to determine whether the EDAC or the memory is failing. The diagnostic function tables will help the user to see the possibilities for diagnostic control.

In the diagnostic mode (S1 = L, S0 = H), the checkword is latched into the input latch while the data input latch remains transparent. This lets the user apply various data words against a fixed known checkword. If the user applies a diagnostic data word with an error in any bit location, the $\overline{\text{ERR}}$ flag should be low. If a diagnostic data word with two errors in any bit location is applied, the $\overline{\text{MERR}}$ flag should be low. After the checkword is latched into the input latch, it can be verified by taking $\overline{\text{OECB}}$ low. This outputs the latched checkword. With the 'ALS632A and 'ALS633, the diagnostic data word can be latched into the output data latch and verified. It should be noted that the 'ALS634 and 'ALS635 do not have this pass-through capability because they do not contain an output data latch. By changing from the diagnostic mode (S1 = L, S0 = H) to the correction mode (S1 = H, S0 = H), the user can verify that the EDAC will correct the diagnostic data word. Also, the syndrome bits can be produced to verify that the EDAC pinpoints the error location. Table 7 ('ALS632A and 'ALS633) and Table 8 ('ALS634 and 'ALS635) list the diagnostic functions.

TABLE 7. 'ALS632A, 'ALS633 DIAGNOSTIC FUNCTION

EDAC FUNCTION	CONTROL S1 S0	DATA I/O	DB BYTE CONTROL $\overline{\text{OEBn}}$	DB OUTPUT LATCH $\overline{\text{LEDBO}}$	CHECK I/O	CB CONTROL $\overline{\text{OECB}}$	ERROR FLAGS $\overline{\text{ERR}}$ $\overline{\text{MERR}}$

NC – No internal connection

description

These devices consist of bus transceiver circuits, with 3-state or open-collector outputs, D-type flip-flops, and control circuitry arranged for multiplexed transmission of data directly from the data bus or from the internal storage registers. Data on the A or B bus will be clocked into the registers on the low-to-high transition of the appropriate clock pin (CAB or CBA). The following examples demonstrate the four fundamental bus-management functions that can be performed with the octal bus transceivers and registers.

Enable ($\overline{G}$) and direction (DIR) pins are provided to control the transceiver functions. In the transceiver mode, data present at the high-impedance port may be stored in either register or in both. The select controls (SAB and SBA) can multiplex stored and real-time (transparent mode) data. The circuitry used for select control will eliminate the typical decoding glitch which occurs in a multiplexer during the transition between stored and real-time data. The direction control determines which bus will receive data when enable $\overline{G}$ is active (low). In the isolation mode (control $\overline{G}$ high), A data may be stored in one register and/or B data may be stored in the other register.

When an output function is disabled, the input function is still enabled and may be used to store and transmit data. Only one of the two buses, A or B, may be driven at a time.

The -1 versions of the SN74ALS' parts are identical to the standard versions except that the recommended maximum I_{OL} is increased to 48 milliamperes. There are no -1 versions of the SN54ALS' parts.

The SN54' family is characterized for operation over the full military temperature range of −55°C to 125°C. The SN74' family is characterized for operation from 0°C to 70°C.

PRODUCTION DATA documents contain information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

8-BIT DIAGNOSTICS/PIPELINE REGISTERS

D2298, NOVEMBER 1985

- High-Speed 8-Bit Parallel Output Register
- Serial Shadow Register with Right-Shift Only
- 'ALS818 Performs Parallel-to-Serial and Serial-to-Parallel Conversion
- Designed Specifically for Use in Applications such as:
  - Write Control Store ('ALS818)
  - Serial Shadow-Register Diagnostics
- 'ALS819 Provides Even-Parity Output
- Low Power Dissipation . . . 215 mW Typical
- 'ALS818 is Functionally Equivalent to AMD AM29818
- Package Options Include Both Plastic and Ceramic Chip Carriers in Addition to Plastic and Ceramic DIPs
- Dependable Texas Instruments Quality and Reliability

description

The 'ALS818 and 'ALS819 are 8-bit output registers with on-chip shadow register for use in applications such as write control store and shadow register diagnostics.

The output registers of the 'ALS818 and 'ALS819 are loaded in parallel from either the I/O port (DQ0—DQ7) or the shadow register. The shadow register of the 'ALS818 is loaded serially from either the I/O port (Y0—Y7) or the output register. The 'ALS819 shadow register is loaded serially from the I/O port (DQ0—DQ7). In addition, the 'ALS819 provides a Parity-Even (PE) output, which monitors parity of the output register. Operation of these devices is controlled by the Mode and SDI inputs as shown in the function table.

The SN54ALS818 and SN54ALS819 are characterized for operation over the full military temperature range of −55°C to 125°C. The SN74ALS818 and SN74ALS819 are characterized for operation from 0°C to 70°C.

DUAL 16-BY-4 REGISTER FILES

D2661, DECEMBER 1982 REVISED MARCH 1985

- 'AS870 in Compact 24-Pin, 300-mil DIP and Both Plastic and Ceramic 28-Pin Chip Carriers
- 'AS871 in 28-Pin 600-mil DIP and Both Plastic and Ceramic Chip Carriers
- 3-State Buffer-Type Outputs Drive Bus Lines Directly
- Typical Access Time is 11 ns
- Each Register File Has Individual Write Enable Controls and Address Lines
- Designed Specifically for Multibus Architecture and Overlapping File Operations
- Prioritized B Input Port Prevents Write Conflicts During Dual Input Mode
- Dependable Texas Instruments Quality and Reliability

description

These devices feature two 16-word by 4-bit register files. Each register file has individual write-enable controls and address lines. The 'AS870 has two 4-bit data I/O ports (DQA1-DQA4 and DQB1-DQB4). The 'AS871 has one 4-bit data I/O port (DQB1-DQB4) with the other data port having individual data inputs (DA1-DA4) and data outputs (QA1-QA4). The data I/O ports can output to Bus A and Bus B, receive input from Bus A and Bus B, receive input from Bus A and output to Bus B, or output to Bus A and receive input from Bus B. To prevent writing conflicts in the dual-input mode, the B input port takes priority. Two select lines, S0 and S1, control which port has access to which register. S2 determines whether the A ports are in the input or the output modes and S3 does likewise for the B ports. The address lines (1A0-1A3 or 2A0-2A3) are decoded by an internal 1-of-16 decoder to select which register word is to be accessed. All outputs are 3-state buffer-type outputs designed specifically to drive bus lines directly.

The SN54AS870 and SN54AS871 are characterized for operation over the full military temperature range of −55°C to 125°C. The SN74AS870 and SN74AS871 are characterized for operation from 0°C to 70°C.

8-BIT UNIVERSAL TRANSCEIVER PORT CONTROLLERS

D2661, DECEMBER 1982 – REVISED AUGUST 1985

- Included Among the Package Options are Compact, 24-Pin, 300-mil-Wide Dips and Both 28-Pin Plastic and Ceramic Chip Carriers
- Buffered 3-State Outputs Drive Bus Lines Directly
- Cascaded to n-Bits
- Eight Selectable Transceiver/Port Functions:
  - A to B or B to A
  - Register to A or Register to B
  - Shifted to A or Shifted to B
  - Off-Line Shifts (A and B Ports in High-Impedance State)
  - Register Clear
- Particularly Suitable for Use in Signature-Analysis Circuitry
- Serial Register Provides:
  - Parallel Storage of Either A or B Input Data
  - Serial Transmission of Data from Either A or B Port
- Dependable Texas Instruments Quality and Reliability

NC No internal connection

description

The 'AS877 features two 8-bit I/O ports (A1-A8 and B1-B8), an 8-bit parallel-load, serial-in, parallel-out shift register, and control logic. With these features, this device is capable of performing eight selectable transceiver or port functions, depending on the state of the three select lines S0, S1, and S2. These functions include: transferring data from port A to port B or vice versa (i.e., the transceiver function), transferring data from the register to either port, serial shifting data to either port, performing off-line shifts (with A and B ports in high-impedance state), and clearing the register. Synchronous parallel loading of the internal register can be accomplished from either port on the positive transition of the clock while serially shifting data in via the SERIN input. The 'AS877 is ideally suited for applications needing signature-analysis circuitry to enhance system verification and/or fault analysis. All serial data is shifted right. All outputs are buffer-type outputs designed specifically to drive bus lines directly and all are 3-state except for Q8, which is a totem-pole output.

The SN54AS877 is characterized for operation over the full military temperature range of −55°C to 125°C. The SN74AS877 is characterized for operation from 0°C to 70°C.

PRODUCTION DATA documents contain information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

t_{PLH}	CLK	QB	2	10.5	2	8	ns
t_{PHL}			3	10	3	8.5	
t_{PHZ}	S0, S1, S2	Any A or B port	2	7.5	2	6.5	ns
t_{PLZ}			3	13	3	10.5	
t_{PZH}			2	9	2	7	ns
t_{PZL}			3	11.5	3	9.5	

NOTE 1: Load circuit and voltage waveforms are shown in Section 1.

[¶] The positive transition of S2 will cause low-level data at the A output Bus or stored in the shift register to be invalid for 12 ns.

SN54AS888, SN74AS888
8-BIT PROCESSOR SLICES

MARCH 1985 REVISED AUGUST 1985

- STL-AS Technology
- Parallel 8-Bit ALU with Expansion Inputs and Outputs
- 13 Arithmetic and Logic Functions
- 8 Conditional Shifts (Single and Double Length)
- 9 Instructions that Manipulate Bytes
- 4 Instructions that Manipulate Bits
- Add and Subtract Immediate Instructions
- Absolute Value Instruction
- Signed Magnitude to/from Two's Complement Conversion
- Polynomial Code Accumulation (CRC, FIRE, Computer Generated, etc.)
- Single- and Double-Length Normalize
- Select Functions
- Signed and Unsigned Divides with Overflow Detection; Input does not Need to be Prescaled
- Signed, Mixed, and Unsigned Multiplies
- Three-Operand, 16-Word Register File
- Full Carry Look Ahead Support
- Sign, Carry Out, Overflow, and Zero-Detect Status Capabilities
- Excess-3 BCD Arithmetic
- Internal Shift Multiplexers that Eliminate the Need for External Shift Control Parts
- ALU Bypass Path to Increase Speeds of Multiply, Divide, and Normalize Instructions and to Provide New Instructions such as Bit Set, Bit Reset, Bit Test, Byte Subtract, Byte Add, and Byte Logical
- 3-Operand Register Files to Allow an Operation and a Move Instruction to be Combined
- Byte Select Controlled by External 3-State Buffers that may be Eliminated if Bit and Byte Manipulation are not Needed
- Bit and Byte Masks that are Shared with Register Address Fields to Minimize Control Store Word Width
- 3 Data Input/Output Paths to Maximize Data Throughput

description

These 8-bit Advanced Schottky TTL integrated circuits are designed to implement high performance digital computers or controllers. An architecture and instruction set has been chosen that supports a fast system clock, a narrow micro-code word width, and a high system throughput. The powerful instruction set allows high-speed system architecture to be implemented and also allows an existing system's performance to be upgraded while protecting software investments. These processors are designed to be cascadable to any word width 16 bits or greater.

The SN54AS888 is characterized for operation over the full military temperature range of −55 °C to 125 °C. The SN74AS888 and SN74AS888-1 are characterized for operation from 0 °C to 70 °C.

Package options include both plastic and ceramic chip carriers in addition to a 68-pin grid array ceramic package.

PRODUCTION DATA documents contain information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

PIN FUNCTIONAL DESCRIPTION

PIN GRID ARRAY	CHIP CARRIER	NAME	I/O	DESCRIPTION
A-10	28	PPP	I	Package position pin. Tri-level input used to define package significance during instruction execution. Leave open for intermediate positions, tie to V_{CC} for most significant package, and tie to GND for least significant package.
B-7	29	SSF	I/O	Special shift function. Used to transfer required information between packages during special instruction execution.
A-9	30	ZERO	I/O	Device zero detection, open collector. Input during certain special instructions.
A-8	31	$\overline{\text{P}}$/OVR	O	ALU propagate/instruction overflow for most significant package, low active.
A-7	32	$\overline{\text{G}}$/N	O	ALU generate/negative result for most significant package, low active.
A-6	33	C_{n+8}	O	ALU ripple carry output.
B-6	34	$\overline{\text{SIO7}}$	I/O	Bidirectional shift pin, low active.
A-5	35	$\overline{\text{QIO7}}$	I/O	
A-4	36	$\overline{\text{QIO0}}$	I/O

PIN FUNCTIONAL DESCRIPTION

PIN GRID ARRAY	CHIP CARRIER	NAME	I/O	DESCRIPTION
K 7	1	$\overline{\text{WE}}$	I	Register file (RF) write enable. Data is written into RF when $\overline{\text{WE}}$ is low and a low-to-high clock transition occurs. RF write is inhibited when $\overline{\text{WE}}$ is high.
L-7	2	B3	I	Register file B port read address select. (0 = LSB).
L-8	3	B2	I	
L-9	4	B1	I	
L-10	5	B0	I	
K-11	6	EB1	I	ALU input operand select. This input with EB0 selects the source of data that the S multiplexer provides for the S bus. Independent control of the DB bus and data path selection allow the user to isolate the DB bus while the ALU continues to process data.
K-9	7	$\overline{\text{OEB}}$	I	DB bus enable, low active.
K-10	8	EB0	I	ALU input operand select. This input with EB1 selects the source of data that the S multiplexer provides for the S bus. Independent control of the DB bus and data path selection allow the user to isolate the DB bus while the ALU continues to process data.
K-8	9	DB7	I/O	B port data bus. Outputs register data ($\overline{\text{OEB}}$ = 0) or used to input external data ($\overline{\text{OEB}}$ = 1), (0 = LSB).
H-10	10	DB6	I/O	
J-11	11	DB5	I/O	
H-11	12	DB4	I/O	
G-11	13	DB3	I/O	
F-11	14	DB2	I/O	
E-11	15	DB1	I/O	
G-10	16	DB0	I/O	
J-10	17	SELY	I	Y bus select, high active.
D-11	18	Y7	I/O	Y port data bus. Outputs instruction results ($\overline{\text{OEY}}$ = 0) or used to put external data into register file ($\overline{\text{OEY}}$ = 1).
C-11	19	Y6	I/O	
D-10	20	Y5	I/O	
C-10	21	Y4	I/O	
F-10	22	Y3	I/O	
E-10	23	Y2	I/O	
B-11	24	Y1	I/O	
B-10	25	Y0	I/O	
B-9	26	$\overline{\text{OEY}}$	I	Y bus output enable, low active.
F-2	27	GND		Ground pin

architectural elements

3-port register file

Working registers consist of 128 storage elements organized into sixteen 8-bit words. These storage elements appear to the user as 16 positive edge-triggered registers. The three port addresses, one write (C) and two reads (A and B), are completely independent of each other to implement a 3-operand register file. Data is written into the register file when $\overline{WE}$ is low and a low-to-high clock transition occurs. The ADD and SUBTRACT immediate instructions require only one source operand. The B address is used as the source address, and the bits of the A address are used to provide a constant field. The SET, RESET, and TEST BIT instructions use the B addressed register as both the source and destination register while the A and C addresses are used as masks. These instructions are explained in more detail in the instruction section.

S multiplexer

The S multiplexer selects the ALU operand, as follows:

EB1	EB0	S bus
Low	Low	RF data
Low	High	MQ data
High	Low	DB data
High	High	MQ data

DB port

Data is passed through the ALU or received from the register file on the 8-bit DB port. If $\overline{OEB}$ is low, the DB bus is active; if $\overline{OEB}$ is high, the DB bus is in the high impedance state. Notice that the DB port may be isolated at the same time that register file data is passed to the ALU.

R multiplexer

The R multiplexer selects the other operand of the ALU. Except for those instructions that require constants or masks, the R bus will contain DA if $\overline{EA}$ is high or the RF data pointed to by A if $\overline{EA}$ is low.

DA bus

The DA bus is active (with register file data) if $\overline{OEA}$ is low. Notice that the DA bus may be isolated while register file data is passed to the ALU.

ALU

The shift instructions are summarized in Table 4 and illustrated in Figure 2. The ALU can perform seven arithmetic and six logical instructions on two 8-bit operands. It also supports multiplication, division, normalization, bit set, reset, test, byte operations, and excess-3 BCD arithmetic. These source operands are the outputs of the S and R multiplexers.

ALU and MQ shifters

ALU and MQ shifters perform all of the shift, multiply, divide, and normalize functions. Table 4 shows the value of the $\overline{SIO7}$ and $\overline{QIO7}$ pins of the most significant package. The standard shifts may be made into conditional shifts and the serial data may be input or output with the aid of two three-state gates. These capabilities are discussed further in the arithmetic and logic section.

MQ register

The multiplier-quotient (MQ) register has specific functions in multiplication, division, and normalization. This register may also be used as a temporary storage register. The MQ register may be loaded if the instruction code on pins I7-I0 is E1-E7 or E9-EE (See Table 1).

Y bus

The Y bus contains the output of the ALU shifter if $\overline{\text{OEY}}$ is low and is a high impedance input if $\overline{\text{OEY}}$ is high. SELY must be low to pass the internal ALU shift bus and must be high to pass the external Y bus to the register file.

status

Four status pins are available on the most significant package, overflow (OVR), sign (N), carry out (C_{n+8}), and zero (ZERO). The C_{n+8} line signifies the ALU result while OVR, ZERO, and N refer the status after the ALU shift has occurred. Notice that the ZERO pin cannot be used to detect whether an input placed on a high impedance Y bus is zero.

divide BCD flip-flops

The multiply-divide flip-flops contain the status of the previous multiply or divide instruction. They are affected by the following instructions:

DIVIDE REMAINDER FIX
SIGNED DIVIDE QUOTIENT FIX
SIGNED MULTIPLY
SIGNED MULTIPLY TERMINATE
SIGNED DIVIDE INITIALIZE
SIGNED DIVIDE START
SIGNED DIVIDE ITERATE
UNSIGNED DIVIDE START
UNSIGNED DIVIDE ITERATE
UNSIGNED MULTIPLY
SIGNED DIVIDE TERMINATE
UNSIGNED DIVIDE TERMINATE

The excess-3 BCD flip-flops are affected by all instructions except NOP. The clear function clears these flip-flops. They preserve the carry from each nibble (4-bits) in excess-3/BCD operations.

package position pin (PPP)

The position of the processor in the system is defined by the voltage level applied to the package position pin (PPP). Intermediate positions are selected by leaving the pin open. Tying the pin to V_{CC} makes the processor the most significant package and tying the pin to GND makes the processor the least significant package.

special shift function (SSF) pin

Conditional shifting algorithms may be implemented via control of the SSF pin. The applied voltage to this pin may be set as a function of a potential overflow condition (the two most significant bits are not equal) or any other condition (see Group 1 instructions).

instruction set

The 'AS888 bit-slice processor uses bits I7-I0 as instruction inputs. A combination of bits I3-I0 (Group 1 instructions) and bits I7-I4 (Group 2-5 instructions) are used to develop the 8-bit op code for a specific instruction. Group 1 and Group 2 instructions can be combined to perform arithmetic or logical functions plus a shift function in one instruction cycle. A summary of the instruction set is given in Table 1.

TABLE 1. INSTRUCTION SET

GROUP 1 INSTRUCTIONS

INSTRUCTION BITS (I3-I0) HEX CODE	MNEMONIC	FUNCTION
0		Accesses Group 4 instructions
1	ADD	$R + S + C_n$
2	SUBR	$\overline{R} + S + C_n$
3	SUBS	$R + \overline{S} + C_n$

§ DB (during select instruction) through Y port.

special instruction switching characteristics

During various special instructions, the SSF pin is used to pass required information between the 'AS888 packages which make up a total system.

For instance, during the multiplication process, the LSB of the multiplier determines whether an ADD/SHIFT or SHIFT operation is performed. During multiplication, the SSF pin of the least significant package (LSP) becomes an output pin while all other packages become input pins.

Similarly, during normalization, the required operation depends on whether the two data MSBs are the same or different. Therefore, during normalization the SSF pin of the most significant package (MSP) becomes an output pin while all other packages become input pins.

Tables 10, 11, and 12 list the instructions which force the SSF pin during their execution. The propagation delay from various inputs is also shown. The parameter which limits normal system performance is indicated by a dagger.

SN54AS890, SN74AS890
MICROSEQUENCERS

D2662, NOVEMBER 1982 REVISED APRIL 1985

- 14 Bits Wide—Addresses up to 16,384 Words of Microcode with One Chip
- Selects Address from One of Eight Sources
- STL-AS Technology
- Independent Read Pointer for Aid in Microcode Diagnostics
- Supports Real-Time Interrupts
- Two Independent Loop Counters
- Supports 64 Powerful Instructions
- Dependable Texas Instruments Quality and Reliability

description

The 'AS890 is a powerful microsequencer that is the result of the implementation of TI's Advanced Schottky and Schottky Transistor Logic. Approximately 2400 Schottky gate equivalents are used to construct this high-performance sequencer. The 'AS890 can generate an address and provide register status in only 29 ns while typically requiring only 1.8 watts of power. All internal STL logic in these devices operates on a 2-volt power supply that must be supplied externally. The information generated by the internal STL logic is communicated in the rest of the system via 5-volt Advanced Schottky TTL-compatible I/O ports.

The microsequencers select a 14-bit microaddress from one of eight sources to provide the proper microinstruction sequence for bit-slice processor or other microcode based systems. These high-performance devices are capable of addressing 16,384 control store memory locations either sequentially or via conditional branching algorithms. This multiway branching capability, coupled with a nine-word deep FILO (first in, last out) stack, allows the microprogrammer to arrange his code in blocks so that microprograms may be structured in the same fashion as such high-level languages as ALGOL, Pascal, or Ada.

Both polled and real-time interrupt routines are supported by the 'AS890 to enhance system throughput capability. Vectored interrupts may occur during any instruction, including PUSHes and POPs.

description (continued)

Two 14-bit loadable registers/counters may be used for temporary storage of data or utilized as down counters for repetitive instructions such as multiplication and division or as loop counters when iterative routines are required.

An additional feature is a 24-bit port that appends four user-definable bits to the DRA or DRB address value for support of 16-way branches for the execution of relative branch addressing schemes.

Y output multiplexer

The Y output multiplexer of the 'AS890 is capable of selecting the next branch address from one of eight locations. Addresses may be sourced from:

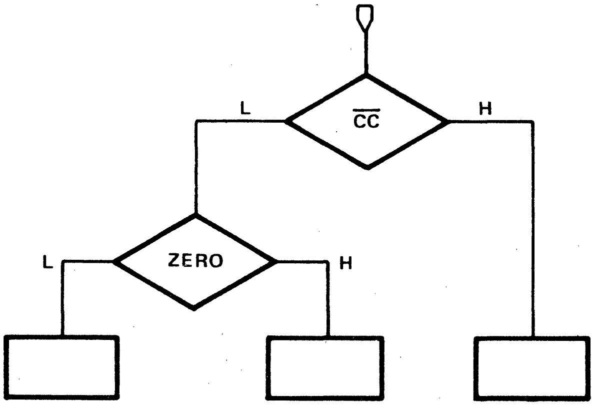
1. The top of the 14-bit by 9-word address stack
2. An external input on the DRA port, potentially a pipeline register
3. An external input on the DRB port, potentially a pipeline register
4. Internal register/counter A
5. Internal register/counter B
6. An internal microprogram counter (MPC register)
7. An external input onto the bidirectional Y output port
8. A 16-way branch—4 bits appended to DRA, DRB, register/counter A or register/counter B.

The source of the next address is dependent upon the previous state of the microsequencer, the MUX controls (MUX2-MUX0), the condition code ($\overline{\text{CC}}$) input, and the state of an internal status flag (status externally available at the ZERO output) that indicates that one of the on-chip registers is being decremented to zero.

The entire instruction set may be made conditional by manipulation of the condition code ($\overline{\text{CC}}$) input. Allowing the $\overline{\text{CC}}$ value to vary as a result of data or status provides for state-dependent or data-dependent branching. Unconditional branches may be achieved by forcing $\overline{\text{CC}}$ high when selecting control store addresses. Holding this pin low will provide for conditional or unconditional branches as dictated by the state of the zero-detect flag. The required control signals for selection of the Y output source are listed in Table 1. Note that the dependence of the 'AS890 on two variables for conditional branches and jumps allows a conditional branch or conditional jump to subroutine in any clock cycle. Also note that all multiplexer inputs are overridden when all of the stack control inputs are pulled low. This instruction resets the stack and read pointers to zero and places all lines of the Y output bus at the low level.

TABLE 1. Y OUTPUT CONTROL

MUX CONTROL			RESET*	Y OUTPUT SOURCE		Y OUTPUT SOURCE
				$\overline{\text{CC}}$ = L		$\overline{\text{CC}}$ = H
MUX2	MUX1	MUX0		ZERO = L	ZERO = H	
X	X	X	YES	ALL LOW	ALL LOW	ALL LOW
L	L	L	NO	STK	MPC	DRA
L	L	H	NO	STK	MPC	DRB
L	H	L	NO	STK	DRA	MPC
L	H	H	NO	STK	DRB	MPC
H	L	L	NO	DRA	MPC	DRB
H	L	H	NO	DRA' (16-WAY BRANCH)	MPC	DRB' (16-WAY BRANCH)
H	H	L	NO	DRA	STK	MPC
H	H	H	NO	DRB	STK	MPC



H = high level, L = low level, X = irrelevant.
*Reset command is implemented by setting S2-S0 = LLL.

14-bit by 9-word address stack

The positive-edge-triggered 14-bit address stack supplies on-board storage of nine control store addresses that support up to nine nested levels of microsubroutine, looping, and real-time interrupt functions. The stack pointer (SP), which operates as an up-down counter, is updated after the execution of each PUSH operation and before each POP. In a PUSH operation, the address stored in the MPC register is loaded into the stack location addressed by the stack pointer, and the stack pointer is incremented. This address is available at the DRA port by enabling DRA ($\overline{\text{RAOE}}$ low and OSEL high).

A POP operation causes the stack pointer to be decremented on the first rising clock edge following the arrival of the POP instruction at the S2-S0 pins. The value that was indexed by the stack pointer is effectively removed from the top of the stack. All PUSH and POP instructions are conditionally dependent upon the stack control inputs (S2-S0), the condition code ($\overline{\text{CC}}$), the input value, and the zero-detect status. The desired option may be selected using the stack control inputs listed in Table 2.

TABLE 2. STACK CONTROL

STACK	CONTROL			STACK OPERATION, $\overline{\text{CC}}$ = L

The read pointer (RP) is a useful tool in debugging microcoded systems. A microprogrammer now has the ability to perform a nondestructive, sequential read of the stack contents from the DRA port. This capability provides the user with a method of backtracking through the address sequence to determine the cause of overflow without affecting program flow, the status of the stack-pointer or the internal data of the stack. Placing a high value on all of the stack inputs (S2-S0) and OSEL places the 'AS890 into the read mode. At each low-to-high clock transition, the value pointed to by the read pointer is available at the DRA port and the read pointer is decremented. Microcode diagnostics are simplified by the ability of the 'AS890 to sequentially dump the contents of its stack. The bottom of the stack is detected by monitoring the STKWRN/RER (stack warning/read error) pin. A high will appear when the stack contains one word and a READ instruction is applied to the S2-S0 pins. This signifies that the last address has been read. The stack pointer and stack contents are uneffected by the READ operation. Under normal PUSH and POP operations the read pointer is updated with the stack pointer and contains identical information.

The STKWRN/RER pin alerts the system to a potential stack overflow or underflow condition. STKWRN/RER becomes active under two additional conditions. If seven of the nine stack locations (0-8) are full (the stack pointer is at 7) and a PUSH occurs, the STKWRN/RER pin will produce a high-level signal to warn that the stack is approaching its capacity, and will be full after one more PUSH. Knowledge that overflow potential exists allows bit-slice-based systems to continuously process real-time interrupt vectors. This signal will remain high, if HOLD, PUSH, or POP instructions occur, until the stack pointer is decremented to 7.

The user may be protected from attempting to POP an empty stack by monitoring STKWRN/RER before POP operations. A high level at this pin signifies that the last address has been removed from the stack (SP = 0). This condition remains until an address is pushed onto the stack and the stack pointer is incremented to one.

Clearing the stack and read pointer is accomplished by placing low levels onto the stack control lines (S2-S0). This function overrides all of the Y output MUX controls and places the Y bus into a low state.

register/counters

Two loadable 14-bit registers extend the looping and branching capabilities. Addresses may be loaded directly into register/counter A (RA) and register/counter B (RB) through the direct data ports DRA13-DRA0 and DRB13-DRB0. The values stored in these registers may either be held, decremented, or read as a result of the register control inputs (RC2-RC0), $\overline{\text{RAOE}}$, and $\overline{\text{RBOE}}$. All combinations of these functions are supported with the exception of a simultaneous decrement of both registers. Generation of iteration routines may be accomplished by loading RA and/or RB and operating them as a down counter. Loop termination is acknowledged by the ZERO output going high to indicate that a register contains a binary one and that a decrement is about to take place. Because of this facility, a "decrement and branch on loop" termination may be executed in the same clock cycle.

The contents of RA are accessible to the DRA port when OSEL is low and the output bus is enabled by RAOE being low. Data from RB is available when DRB is enabled by $\overline{\text{RBOE}}$ being low. Note that control of the registers is maintained while an external value is active on the DRA and DRB ports. A value being directed from the DRA and DRB buses to the output will not inhibit the decrement operation.

Register/counter controls are listed in Table 3.

TABLE 3. REGISTER CONTROL

L	H	H	DEC	LOAD
H	L	L	LOAD	LOAD
H	L	H	HOLD	DEC
H	H	L	HOLD	LOAD
H	H	H	LOAD	DEC

microprogram register and increment

The microprogram register (MPC) and the incrementer (INC) provide the means for generating the next microprogram address for sequential addressing operations. The MPC may be loaded with either the outgoing address on the Y bus or may receive an external address for processing interrupt vectors.

The current address on the Y bus is passed to the MPC at each rising clock edge, either unaltered (INC low) for repeating statements, or incremented by one (INC high) for addressing sequential control store locations.

The MPC may also be externally loaded for subroutine and interrupt functions. Taking $\overline{\text{YOE}}$ high and forcing the new address onto the bidirectional Y bus loads the MPC with the new address at the positive clock edge. This value may also be incremented prior to storage in the MPC for sequential addressing of subroutines or interrupt routines.

interrupts

Real-time vectored interrupt routines are supported for those applications where polling would impede system throughput. Any instruction, including PUSHes and POPs, may be interrupted. To process an interrupt, the following procedure should be followed:

1. The bidirectional Y bus is placed into the high-impedance state by forcing $\overline{\text{YOE}}$ high.
2. The interrupt entry point vector is then forced onto the Y bus and incremented to become the second microinstruction of the interrupt routine. This is accomplished by making INC high.

3. At the following clock edge, the second microaddress is stored in the MPC and the interrupted address will be stored in the INT RT register which always contains the outgoing value on the Y bus. This edge also causes the processor to begin execution of the first instruction of the interrupt routine. This first instruction must PUSH the address stored in the INT RT register onto the stack so that the proper return linkage is maintained. This is accomplished by making $\overline{\text{INT}}$ low and performing a PUSH. If this instruction were to be interrupted, the process would be repeated and the proper return linkage preserved.

control inputs

A listing of the response of internal elements to various control inputs is given in Table 4.

TABLE 4. RESPONSE TO CONTROL INPUTS

PIN NAME	LOGIC LEVEL	
	HIGH	LOW
$\overline{\text{RAOE}}$	DRA output in high-Z state	DRA output is active
$\overline{\text{RBOE}}$	DRB output in high-Z state	DRB output is active
$\overline{\text{YOE}}$	Y output in high-Z state	Y output is active
$\overline{\text{INT}}$	MPC to stack	INT RT register to stack
OSEL	Stack to DRA buffer input	RA to DRA buffer input
INC	Adds one to Y output and stores in MPC	Passes Y output to MPC unaltered
MUX2-MUX0	Table 1	Table 1
S2-S0	Table 2	Table 2
RC2-RC0	Table 3	Table 3

instruction set

Sixty-four microsequencing instructions enable the 'AS890 to generate micro-addresses for up to 16,384 locations. Any instruction can be made conditional depending upon the value of the externally applied condition code ($\overline{\text{CC}}$) and the value stored in either of the internal register/counters.

The required signals for selection of the Y output source were listed in Table 1. Suggested methods for implementing a few commonly used instructions are given in Table 5 and flowcharts showing execution examples are illustrated in Figure 1.

It should be noted that the term jump refers to a subroutine call that must be accompanied by a return instruction. The term branch implies that a deviation from the program flow is accomplished but no return is required.

16-BIT PARALLEL/SERIAL BARREL SHIFTERS

D2885, OCTOBER 1985

- **High-Speed "Flash" Shift Operations**
- **Expandable to 32 Bits**
- **Normalization with Leading Zero Detection**
- **Bit Reversal**
- **Merge Capabilities**
- **Texas Instruments Quality and Reliability**

description

The SN54AS897 and SN74AS897 are multipurpose 16-bit barrel shifters in a 68-pin ceramic pin-grid-array package. The device is capable of several different types of shift operations, as well as other more specialized functions such as normalization, bit replacement, and leading-zero detection.

The unique feature of all barrel shifters is how the shift function is implemented. In conventional shift registers, shift operations are controlled by the number of input clock pulses applied. With barrel shifters, the desired number of positions to be shifted is determined by an input decoder. This form of implementation does not require an input clock and results in a shift operation that is restricted only by internal propagation delays. This delay is the same regardless of the number of positions to be shifted. The result is a high-speed "flash" type of shift.

PIN FUNCTIONAL DESCRIPTION

PIN		I/O	DESCRIPTION
NAME	NO.		
ZN0 ZN1 ZN2 ZN3	B4 A2 A3 A4	I/O I/O I/O I/O	A four-bit code that performs the following functions in the 16-bit mode: 1. As an input in shift instructions, specifies how many bit positions are to be shifted. 2. As an input in replace instructions, specifies position of the bit to be replaced. 3. As an input to the normalize instruction, specifies the number of left shifts to be performed. 4. As an output from the normalize instruction, when $\overline{\text{NORM}}$ = L, specifies the number of leading zeros in the data on D15-D0.
ZN4	B6	I/O	ZN4 is concatenated with ZN3-ZN0 for use in 32-bit shift operations as described above.
GND GND GND GND GND GND GND GND GND GND GND GND GND	A5 A8 B9 D11 F1 F10 G2 H10 J1 J10 J11 K5 K7		Ground (All ground pins should be used)
$\overline{\text{NORM}}$	A6	I	A three-state control input for ZN4-ZN0 I/O ports used only in normalize instructions. When $\overline{\text{NORM}}$ is low, the number of leading zeros detected in the data present on D15-D0 is output on ZN4-ZN0. When $\overline{\text{NORM}}$ is high, ZN4-ZN0 act only as inputs.
ZL	A7	I/O	An input/open-collector output used primarily in 32-bit applications. When the input at D15-D0 is zero, the ZL output is high. The ZL outputs of cascaded packages are connected in a wired-AND configuration to detect if all inputs are zero. A recommended pull-up resistor of 200-680 Ω must be provided externally for proper operation in the 32-bit mode.
16B/$\overline{\text{32B}}$	A9	I	When high, 16-bit operation is selected. When low, 32-bit operation is selected.
OP	A10	I	In the 16-bit mode, controls the source of input data. A logic high on this input selects data from the register/counter. A low selects data on the D15-D0 inputs. In the 32-bit mode, defines the package output positions. When OP is high, Y15-Y0 are in the most significant output position. When OP is low, Y15-Y0 are in the least significant output position.
IP	B7	I	In the 16-bit mode, controls the bit-reversal option. A high logic level causes data selected by OP to be bit-reversed before it is passed to the shifter. When IP is low, data is passed unaltered. In the 32-bit mode, defines the data input position. When IP is high, D15-D0 are in the most significant input position. When IP is low, D15-D0 are in the least significant position.

PIN FUNCTIONAL DESCRIPTION (Continued)

PIN NAME	PIN NO.	I/O	DESCRIPTION
D0	L2	I	Input data bits 0 through 15
D1	K2	I	
D2	K1	I	
D3	J2	I	
D4	G1	I	
D5	H2	I

Y13	C10	I/O	
Y14	E10	I/O	
Y15	B11	I/O	
NC	D10		No internal connection
NC	H1		
M0	L4	I	Shift instruction control. Determine the type of shift operation to be performed. See Table 1 for further information.
M1	K4	I	
M2	L3	I	
CLK	K6	I	Clock input. Loads the internal register on the low-to-high transition. In 16-bit circular mode, acts as clock for the 16-bit/14-bit counter.
$\overline{TP}$	L5	I	Functional testing input. When low, transforms the 16-bit counter into four 4-bit counters. During normal operation, $\overline{TP}$ must be maintained at a high logic level.
$\overline{OEY}$	L6	I	Control input for the Y15-Y0 I/O ports. When $\overline{OEY}$ is low, the Y outputs are enabled.

description (continued)

control block

The control block decodes the M2-M0 instruction inputs, 16B/$\overline{\text{32B}}$ configuration select, IP and OP data select/bit reversal options, and other control inputs and transmits the resulting control signals to the rest of the internal logic.

instruction set

The 'AS897 can operate in any of the eight user-programmable shift modes shown in Table 1. Selection of these instructions is controlled by pins M2-M0.

TABLE 1. INSTRUCTION SET

M2	M1	M0	DESCRIPTION
L	L	L	Shift right the number of bit positions defined by ZN3-ZN0 (16-bit mode) or ZN4-ZN0 (32-bit mode). Fill vacated bit positions with logic level on S input.
L	L	H	Shift left the number of bit positions defined by ZN3-ZN0 (16-bit mode) or ZN4-ZN0 (32-bit mode). Fill vacated bit positions with logic level on S input.
L	H	L	Circular right shift the number or bit positions defined by ZN3-ZN0 (16-bit mode) or ZN4-ZN0 (32-bit mode).
L	H	H	Circular left shift the number of bit positions defined by ZN3-ZN0 (16-bit mode) or ZN4-ZN0 (32-bit mode).
H	L	L	Shift right the number of bit positions defined by ZN3-ZN0 (16-bit mode) or ZN4-ZN0 (32-bit mode). Fill vacated bit positions with logic level on S input. Merge result with data from the register/counter.
H	L	H	Shift left the number of bit positions defined by ZN3-ZN0 (16-bit mode) or ZN4-ZN0 (32-bit mode). Fill vacated bit positions with logic level on S input. Merge result with data from the register/counter.
H	H	L	Set the bit position defined by ZN3-ZN0 (16-bit mode) or ZN4-ZN0 (32-bit mode) to the logic level on the S input.
H	H	H	If $\overline{\text{NORM}}$ is low, shift data left until the most significant bit contains a logic high. Fill vacated bit positions with logic level on S input. If $\overline{\text{NORM}}$ is low, output number of leading zeros in D15-D0 on ZN3-ZN0 (16-bit mode) or ZN4-ZN0 (32-bit mode). Note: If $\overline{\text{NORM}}$ is high, this instruction performs like the left shift described above for M2 = L, M1 = L, M0 = H.

mode configuration

The 'AS897 can be configured to operate on 16-bit or 32-bit words. Configuration is controlled by 16B/$\overline{\text{32B}}$. When 16B/$\overline{\text{32B}}$ is high, the 'AS897 operates in 16-bit mode.

Figure 1 illustrates the connection of four 'AS897s to provide a 32-bit barrel shifter that can perform all Table 1 shift instructions. For 32-bit mode operation, the 16B/$\overline{\text{32B}}$ inputs of all 'AS897 devices must be low and should be configured as shown in Figure 1.

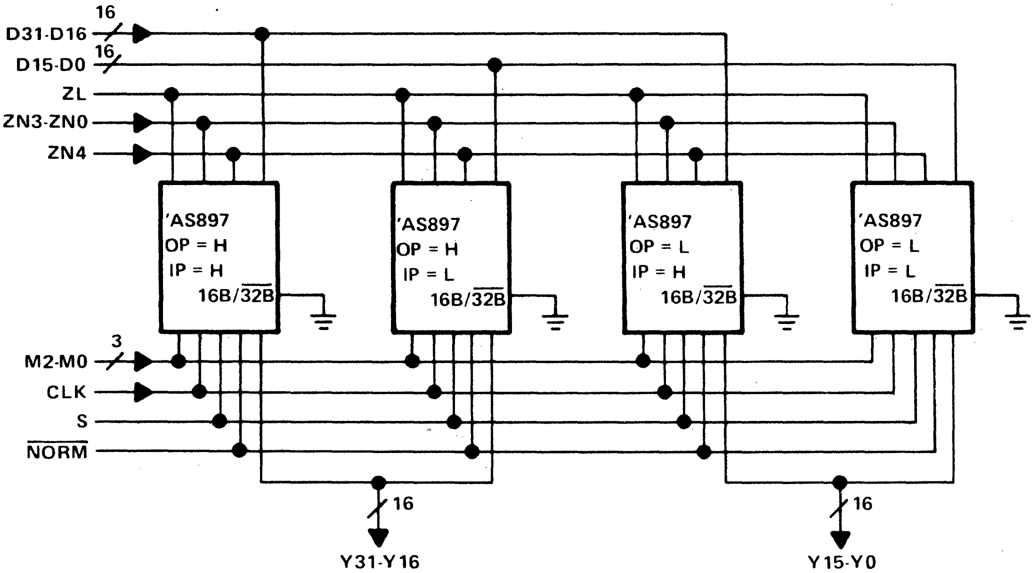

FIGURE 1. 32-BIT BARREL SHIFTER

data input/output

Data can be input to the chip from two ports: D15-D0, which passes data to the zero detector and to the shifter via the data select and bit-reversal multiplexers, and Y15-Y0, which passes data to the register/counter. Y15-Y0 is also used to output the shift result from the chip.

Data input and output positions in the 32-bit mode are defined by IP and OP (see Table 2). When IP is high, the D15-D0 port is the most significant input position; when IP is low, the D15-D0 input port is the least significant. If OP is high, the Y15-Y0 port is the most significant output position; if OP is low, the Y15-Y0 port is the least significant position.

TABLE 2. IP AND OP CONTROLS

SIGNAL	16-BIT OPERATION (16B/$\overline{32B}$ = H)	32-BIT OPERATION (16B/$\overline{32B}$ = L)
IP = L	Bit-reversal option off	D15-D0 is least significant input position
IP = H	Bit-reversal option on	D15-D0 is most significant input position
OP = L	D15-D0 is shifted	Y15-Y0 is least significant output position
OP = H	Register/counter data is shifted	Y15-Y0 is most significant output position

zero detector

The zero detector detects the number of leading zeros at the D15-D0 input port. If all zeros are detected, the ZL output transistor will be turned off. If the ZL output pin is pulled up through the recommended pull-up resistor (see pin description table), the resulting signal will be high. If anything other than a zero is detected on the D15-D0 inputs, the output transistor will be turned on; this will pull the ZL signal low.

During data normalization (M2 = H, M1 = H, M0 = H), the zero-detector outputs the leading zero count to the ZN4-ZN0 I/O ports, provided $\overline{\text{NORM}}$ is low. When $\overline{\text{NORM}}$ is high, ZN4-ZN0 act only as inputs in this mode. For operations other than normalization, the state of $\overline{\text{NORM}}$ is irrelevant.

In the data-normalization mode, a high logic level will be output on the ZN4 pin when the D15-D0 bus contains all lows and $\overline{\text{NORM}}$ is low (see Table 3).

TABLE 3. ZN4 I/O PORT

SIGNAL	I/O	16-BIT CONFIGURATION ($16B/\overline{32B}$ = H)	32-BIT CONFIGURATION ($16B/\overline{32B}$ = L)
ZN4	I	Inactive	With ZN3-ZN0 indicates number of bits to be shifted in shift operations and position of bit to be replaced in replace-bit mode.
	O	In the normalization mode, when $\overline{\text{NORM}}$ = L, indicates when the input to the shifter is zero	In the normalization mode, when $\overline{\text{NORM}}$ = L, ZN4-ZN0 indicates number of leading zeros detected in D15-D0 and number of places to be shifted for normalization.

data selector multiplexer

The data selector multiplexer is used only in 16-bit operation ($16B/\overline{32B}$ = H). OP controls the mux and selects the data to be presented to the bit-reversal block. OP high selects the register/counter; OP low selects D15-D0 (see Table 2).

bit reversal

Bit reversal is also available only in the 16-bit mode ($16B/\overline{32B}$ = H) and is controlled by IP (see Table 2). When the bit-reversal option is selected (IP = H), data selected by OP is bit-reversed before it is passed to the shifter: the most significant bit becomes the least significant bit, the second most significant bit becomes the second least significant bit, and so forth. When the bit-reversal option is off (IP = L), the data presented to the shifter is not altered.

register/counter

During most instructions, the register/counter operates as a data latch. Data on the Y15-Y0 bus is latched into the register/counter on the rising edge of the clock. Data can be input to the register/counter from the shifter ($\overline{\text{OEY}}$ = L) or from the bidirectional Y port ($\overline{\text{OEY}}$ = H).

In the 16-bit circular-shift mode ($16B/\overline{32B}$ = H, M2 = L, M1 = H, M0 = X), the register counter will function as a 16-bit counter on the rising edge of the clock when S is high. Under these same conditions, the register/counter will function as four 4-bit counters when $\overline{\text{TP}}$ is low. In the 16-bit circular-shift mode, the register/counter functions as a register when S is low. The counter option is not available for other instructions in the 16-bit mode or for any instructions in the 32-bit mode.

shifter

The shifter performs the operations specified by the M2-M0 inputs (see Table 1). The number of bits to be shifted or the position of the bit to be replaced is specified by ZN3-ZN0 (16-bit operation) or ZN4-ZN0 (32-bit operation).

merge

During the shift and merge instruction (M2 = H, M1 = L, M0 = X), the merge block ORs the shift result with data from the register/counter.

S or Z fill

During bit replacement (M2 = H, M1 = H, M0 = L) in the 16-bit mode, this block sets the bit specified on the ZN3-ZN0 inputs with the logic level on the S input. This option works identically in the 32-bit mode, except that the bit to be replaced is specified on the Z4-Z0 inputs.

Z fill is used in the 32-bit mode to selectively put the device outputs in a high-impedance state. This feature is necessary to properly select the correct bit locations that will combine to form the shifted output. An example of a 32-bit circular shift four positions to the right, which illustrates the Z-fill technique, is shown in Figure 2.

Figure 4 shows the three-device configuration. The limitation of this application is that only 23 bits of the 32 bits are used in the significand, and the sign bit must be set from hardware. As an alternate to the IEEE floating-point format, the same hardware configuration can be used to normalize a 32-bit data word resulting in a 32-bit significand and a five-bit exponent.

description

These 10-bit latches are designed specifically for storing the contents of the input data bus plus providing the capability of reading-back the stored data onto the input data bus.

The ten latches of the 'ALS994 and 'ALS995 are transparent D-type. While the enable (C) is high, the Q outputs of the 'ALS994 will follow the data (D) inputs. For the 'ALS995, the Q outputs will provide the inverse of what is applied to its data (D) inputs.

Read-back is provided through the read-back control input ($\overline{\text{OERB}}$). When the control is taken low, the data present at the output of the data latches will be allowed to pass back onto the input data bus. When it is taken high, the output of the data latches will be isolated from the data (D) inputs. The read-back control does not affect the internal operation of the latches; however, precautions should be taken not to create a bus-conflict situation.

The SN54ALS994 and SN54ALS995 are characterized for operation over the full military temperature range of −55°C to 125°C. The SN74ALS994 and SN74ALS995 are characterized for operation from 0°C to 70°C.

NC – No internal connection.

description

These 8-bit registers are designed specifically for storing the contents of the input data bus plus providing the capability of reading-back the stored data onto that bus. The Q outputs are designed with bus-driving capability.

The edge-triggered flip-flops enter the data on the low-to-high transition of the clock (CLK) when enable ($\overline{\text{EN}}$) is low. Data can be read-back onto the data inputs by taking the read input ($\overline{\text{RD}}$) low, in addition to having $\overline{\text{EN}}$ low. Whenever $\overline{\text{EN}}$ is high, both the read-back and write modes are disabled. Transitions on $\overline{\text{EN}}$ should only be made with CLK high in order to prevent false clocking.

The polarity of the Q outputs can be controlled by the polarity input T/$\overline{\text{C}}$. When T/$\overline{\text{C}}$ is high, Q will be the same as is stored in the flip-flops. When T/$\overline{\text{C}}$ is low, the output data will be inverted. The Q outputs can be placed in a high-impedance state by taking the output control ($\overline{\text{G}}$) high. The output control $\overline{\text{G}}$ does not affect the internal operations of the register. Old data can be retained or new data can be entered while the outputs are off.

A low level at the clear input ($\overline{\text{CLR}}$) resets the internal registers low. The clear function is asynchronous and overrides all other register functions.

The SN54ALS996 is characterized for operation over the full military temperature range of −55°C to 125°C. The SN74ALS996 is characterized for operation from 0°C to 70°C.

description

The 'ALS2967 and 'ALS2968 dynamic memory controllers (DMCs) are designed for use in today's high-performance memory systems. The DMC acts as the address controller between any processor and dynamic memory array.

Two versions are provided that help simplify interfacing to the system dynamic timing controller. The 'ALS2967 offers active-low Row Address Strobe Input ($\overline{\text{RASI}}$) and Column Address Strobe Input ($\overline{\text{CASI}}$), while the 'ALS2968 offers active-high Row Address Strobe Input (RASI) and Column Address Strobe Input (CASI) inputs.

Using two 9-bit address latches, the DMC will hold the row and column addresses for any DRAM up to 256K. These latches and the two row/column refresh address counters feed into a 9-bit, 4-input MUX for output to the dynamic RAM address lines. A 2-bit bank select latch is provided to select one of the four $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ outputs. The two bits are normally obtained from the two highest-order address bits.

The 'ALS2967 and 'ALS2968 have two basic modes of operation, read/write and refresh. During normal read/write operations, the row and column addresses are multiplexed to the dynamic RAM, with the corresponding $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ signals activated to strobe the addresses into the RAM. In the refresh mode, the two counters cycle through the refresh addresses. If memory scrubbing is not being implemented, only the row counter is used. When memory scrubbing is being performed, both the row and column counters are used to perform read-modify-write cycles. In this mode all $\overline{\text{RAS}}$ outputs will be active (low) while only one $\overline{\text{CAS}}$ output is active at a time.

The SN54ALS2967 and SN54ALS2968 are characterized for operation over the full military temperature range of −55°C to 125°C. The SN74ALS2967 and SN74ALS2968 are characterized for operation from 0°C to 70°C.

TABLE 1. PIN FUNCTION

PIN NAME	DESCRIPTION
A0-A17	Address Inputs. A0-A8 are latched in as the nine-bit row address for the DRAM. These inputs drive Q0-Q8 when the DMC is in the read/write mode and MSEL is low. A9-A17 are latched in as the column address, and will drive Q0-Q8 when MSEL is high and the DMC is in the read/write mode. The addresses are latched when the Latch Enable (LE) input signal is low.
SEL0, SEL1	Bank Select. These two inputs are normally the two highest-order address bits and are used in the read/write mode to select which bank of memory will be receiving the $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ signals after $\overline{\text{RASI}}$ ('ALS2967) or RASI ('ALS2968) and $\overline{\text{CASI}}$ ('ALS2967) or CASI ('ALS2968) go active.
LE	Latch Enable. This active-high input causes the row, column, and bank select latches to become transparent, allowing the latches to accept new input data. A low input on LE latches the input data.
MSEL	Multiplexer Select. This input determines whether the row or column address will be sent to the memory address inputs. When MSEL is high, the column address is selected, while the row address is selected when MSEL is low. The address may come from either the address latch or refresh address counter depending on MC0 and MC1 (see Mode Control Function Table).
$\overline{\text{CS}}$	Chip Select. This active-low input is used to enable the DMC. When $\overline{\text{CS}}$ is active, the DMC operates normally in all four modes. When $\overline{\text{CS}}$ goes high, the device will not enter the read/write mode. This allows other devices to access the same memory that the DMC is controlling.
$\overline{\text{OE}}$	Output Enable. This active-low input enables/disables the output signals. When $\overline{\text{OE}}$ is high, the outputs of the DMC enter the high-impedance state.
MC0-MC1	Mode Controls. These inputs determine in which of the four modes the DMC operates. The description of each of the four operating modes is given in Table 2.
Q0-Q8	Address Outputs. These address outputs feed the DRAM address inputs and provide drive for memory systems having capacitance of up to 500 picofarads.
$\overline{\text{RASI}}$ or RASI	Row Address Strobe Input. During the normal memory cycles, the decoded $\overline{\text{RAS}}$n output ($\overline{\text{RAS0}}$, $\overline{\text{RAS1}}$, $\overline{\text{RAS2}}$, or $\overline{\text{RAS3}}$) is forced low after receipt of an active Row Address Strobe Input signal. In either Refresh mode, all four $\overline{\text{RAS}}$ outputs will be low while the Row Address Strobe Input signal is active. The $\overline{\text{RASI}}$ on the 'ALS2967 is an active-low input while on the 'ALS2968, RASI is an active-high input. (For more details see timing diagrams).
$\overline{\text{RAS0}}$-$\overline{\text{RAS3}}$	Row Address Strobe. Each of the Row Address Strobe outputs provides a $\overline{\text{RAS}}$ signal to one of the four banks of dynamic memory. Each $\overline{\text{RAS}}$n output will go low when selected by SEL0 and SEL1 after $\overline{\text{RASI}}$ ('ALS2967) or RASI ('ALS2968) goes active. All four go low in response to $\overline{\text{RASI}}$ ('ALS2967) or RASI ('ALS2968) while in the refresh mode.
$\overline{\text{CASI}}$ or CASI	Column Address Strobe Input. This input going active causes the selected $\overline{\text{CAS}}$ output to be forced low. The $\overline{\text{CASI}}$ input on the 'ALS2967 is active low input while on the 'ALS2968, CASI is active high input. (For more details see timing diagrams.)
$\overline{\text{CAS0}}$-$\overline{\text{CAS3}}$	Column Address Strobe. During normal Read/Write cycles the two selected bits (SEL0, SEL1) determine which $\overline{\text{CAS}}$ output will go active following $\overline{\text{CASI}}$ ('ALS2967) or CASI ('ALS2968) going active. When memory scrubbing is being performed, only the $\overline{\text{CAS}}$n signal selected will be active. For non-scrubbing cycles, all four $\overline{\text{CAS}}$ outputs will remain high.

TABLE 2. MODE-CONTROL FUNCTION TABLE

MC1	MC0	OPERATING MODE
L	L	Refresh Mode without Scrubbing. Refresh cycles are performed with only the row counter being used to generate the addresses. In this mode, all four $\overline{RAS}$ outputs are active while the four $\overline{CAS}$ outputs remain high.
L	H	Refresh with Scrubbing/Initialize. During this mode, refresh cycles are done with both the row and column counters generating the addresses. MSEL is used to select either the row or the column counter. All four $\overline{RAS}$ outputs go low in response to $\overline{RASI}$ ('ALS2967) or RASI ('ALS2968), while only one $\overline{CAS}$n output goes low in response to $\overline{CASI}$ ('ALS2967) or CASI ('ALS2968). The bank counter keeps track of which $\overline{CAS}$ output goes active. This mode can also be used during system power-up so that the memory can be written with a known data pattern.
H	L	Read/Write. This mode is used to perform read/write cycles. Both the Row and Column addresses are multiplexed to the address output lines using MSEL. SEL0 and SEL1 are decoded to determine which $\overline{RAS}$n and $\overline{CAS}$n outputs will be active.
H	H	Clear Refresh Counters. This mode clears the three refresh counters (row, column, and bank) on the inactive transition of $\overline{RASI}$ ('ALS2967) or RASI ('ALS2968), putting them at start of the refresh sequence (see timing diagrams for more detail). In this mode, all four RAS outputs are driven low after the active edge of $\overline{RASI}$ ('ALS2967) or RASI ('ALS2968) so that DRAM wake-up cycles may also be performed.

[†] If LE is low, outputs will be the levels entered when LE was last high. If LE is high, outputs will follow address inputs as selected by MSEL.
[‡] For 'ALS2967, clearing occurs on the low-to-high transition of $\overline{\mathrm{RASI}}$; for 'ALS2968, clearing occurs on the high-to-low transition of RASI.

read/write operation details

During normal read/write operations, the row and column addresses are multiplexed to the dynamic RAM controlled by the MSEL input. The corresponding $\overline{\text{RAS}}$n and $\overline{\text{CAS}}$n output signals strobe the addresses into memory. The block diagram in Figure 1 shows a typical system interface for a one-megaword dynamic memory. The DMC is used to control the four banks of 256K memory.

For systems where addresses and data are multiplexed onto a single bus, the DMC uses latches, (row, column, and bank) to hold the address information. Figure 5 shows a typical timing diagram using the input latches. The twenty input latches are transparent when latch enable (LE) is high, and latch the input data whenever LE is taken low. For systems in which the processor has separate address and data buses, LE may be permanently high (see timing diagram in Figure 4).

read/write operations (continued)

The DMC is designed with heavy-duty outputs that are capable of driving four banks of 16-bit words, including six checkbits used for error detection and correction.

In addition to heavy-duty output drivers, the outputs are designed with balanced output impedances (25 Ω both high and low). This feature optimizes the drive low characteristics, based on safe undershoot, while providing symmetrical drive high characteristics. It also eliminates the external resistors required to pull the outputs up to the MOS V_{OH} level (V_{CC} − 1.5 V).

memory expansion

With a 9-bit address path, the DMC can control up to one megaword when using 256K dynamic RAMs. If a larger memory size is desired, the DMC's chip select ($\overline{CS}$) makes it easy to expand the memory size by using additional DMCs. A four-megaword memory system is shown in Figure 3.

To maintain maximum performance in 32-bit applications, it is recommended that individual bus drivers be used for each bank.

refresh operations

The two 9-bit counters in the 'ALS2967 and 'ALS2968 support 128-, 256-, and 512-line refresh operations. Transparent, burst, synchronous, or asynchronous refresh modes are all possible. The refresh counters are advanced on the low-to-high transition of $\overline{\text{RASI}}$ on the 'ALS2967, and on the high-to-low transition of RASI on the 'ALS2968. The refresh counters are reset to zero on the low-to-high transition of $\overline{\text{RASI}}$ on the 'ALS2967, and on the high-to-low transition of RASI on the 'ALS2968, if MC1 and MC0 are at a low logic level. See Figure 8 for additional timing details.

When performing refresh cycles without memory scrubbing (MC1 and MC0 both low), all four $\overline{\text{RAS}}$ outputs go low, while all $\overline{\text{CAS}}$ outputs are driven high. Typical timing for this mode of operation is shown in Figure 6.

THCT4502
DYNAMIC RAM CONTROLLER

D2905, OCTOBER 1985

- Inputs are TTL- and CMOS-Voltage Compatible
- Controls Operation of 64K and 256K Dynamic RAMs
- Creates Static RAM Appearance
- One Package Contains Address Multiplexer, Refresh Control, and Timing Control
- Directly Addresses and Drives Up to 2 Megabytes of Memory Without External Drivers
- Operates from Microprocessor Clock
  - No Crystals, Delay Lines, or RC Networks
  - Eliminates Arbitration Delays
- Refresh May Be Internally or Externally Initiated
- Versatile
  - Strap-Selected Refresh Rate
  - Synchronous, Predictable Refresh
  - Selection of Distributed, Transparent, and Cycle-Steal Refresh Modes
  - Interfaces Easily to Popular Microprocessors
  - Asynchronous $\overline{\text{RESET}}$ Function Provided in FK and FN Packages
- High-Performance Si-Gate CMOS Technology
- Strap-Selected Wait State Generation for Microprocessor/Memory Speed Matching
- Ability to Synchronize or Interleave Controller with the Microprocessor System (Including Multiple Controllers)
- 3-State Outputs Allow Multiport Memory Configuration
- Performance Range:
  125 ns ALE low to $\overline{\text{CAS}}$ low
- Compatible with TMS4500A/B and with VTI VL4500A and VL4502
- Available in Plastic and Ceramic Chip Carriers in Addition to Plastic and Ceramic DIPs
- Dependable Texas Instruments Quality and Reliability

THCT4502
DYNAMIC RAM CONTROLLER

description

The THCT4502 is a monolithic DRAM system controller providing address multiplexing, timing, control and refresh/access arbitration functions to simplify the interface of dynamic RAMs to microprocessor systems.

The controller contains an 18-bit multiplexer that generates the address lines for the memory device from the 18 system address bits and provides the strobe signals required by the memory to decode the address. A 9-bit refresh counter generates up to 512 row addresses required to refresh.

A refresh timer is provided to generate the necessary timing to refresh the dynamic memories and ensure data retention.

The THCT4502 also contains refresh/access arbitration circuitry to resolve conflicts between access requests and memory-refresh cycles.

The THCT4502 is characterized for operation from 0°C to 70°C.

pin descriptions

RA0-RA8	Input	Row Address — These address inputs are used to generate the row address for the multiplexer.
CA0-CA8	Input	Column Address — These address inputs are used to generate the column address for the multiplexer.
MA0-MA8	Output	Memory Address — These three-state outputs are designed to drive the addresses of the dynamic RAM array.
ALE	Input	Address Latch Enable — This input is used to latch the 18 address inputs, $\overline{\text{CS}}$, REN0, and REN1. This also initiates an access cycle if $\overline{\text{CS}}$ is low. The rising edge (low level to high level) of ALE returns all $\overline{\text{RAS}}$ outputs to the high level.
$\overline{\text{CS}}$	Input	Chip Select — A low on this input enables an access cycle. The trailing edge of ALE latches the chip select input.
REN0, REN1	Inputs	$\overline{\text{RAS}}$ Enable 0 and 1 — These inputs are used to select one of four banks of RAM when $\overline{\text{CS}}$ is low. When REN1 is low, the lower banks are enabled via $\overline{\text{CAS0}}$, $\overline{\text{RAS0}}$, and $\overline{\text{RAS1}}$. When REN1 is high, the higher banks are enabled via $\overline{\text{CAS1}}$, $\overline{\text{RAS2}}$ and $\overline{\text{RAS3}}$. REN0 selects $\overline{\text{RAS0}}$ and $\overline{\text{RAS2}}$ when low, or $\overline{\text{RAS1}}$ and $\overline{\text{RAS3}}$ when high. (see Table 2).
$\overline{\text{ACR}}$, $\overline{\text{ACW}}$	Input	Access Control, Read; Access Control, Write — A low on either of these inputs causes the column address to appear on MA0-MA8 and a low-going pulse from $\overline{\text{CAS}}$. The rising edge of $\overline{\text{ACR}}$ or $\overline{\text{ACW}}$ terminates the cycle by forcing $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ high. When $\overline{\text{ACR}}$ and $\overline{\text{ACW}}$ are both low, MA0-MA8, $\overline{\text{RAS0}}$, $\overline{\text{RAS1}}$, $\overline{\text{RAS2}}$, $\overline{\text{RAS3}}$, $\overline{\text{CAS0}}$ and $\overline{\text{CAS1}}$ go into a high-impedance (floating) state.
CLK	Input	System Clock — This input provides the master timing to generate refresh cycle timings and refresh rate. Refresh rate is determined by the TWST, FS1, and FS0 inputs.
$\overline{\text{REFREQ}}$	Input	Refresh Request — This input should be driven by an open-collector or open-drain output. On input, a low-going edge initiates a refresh cycle and will cause the internal refresh timer to be reset on the next falling edge of the CLK. As an output, a low-going edge signals an internal refresh request and that the refresh timer will be reset on the next low-going edge of CLK. $\overline{\text{REFREQ}}$ will remain low until the refresh cycle is in progress and the current refresh address is present on MA0-MA8. (Note: $\overline{\text{REFREQ}}$ contains an internal active pullup with a nominal resistance of 10 kΩ, which is disabled when $\overline{\text{REFREQ}}$ is low).
$\overline{\text{RAS0}}$, $\overline{\text{RAS1}}$ $\overline{\text{RAS2}}$, $\overline{\text{RAS3}}$	Output	Row Address Strobe — These three-state outputs are used to latch the row address into the bank of DRAMs selected by REN0 and REN1. On refresh, all $\overline{\text{RAS}}$ signals are active.
$\overline{\text{CAS0}}$, $\overline{\text{CAS1}}$	Output	Column Address Strobe — These three-state outputs are used to latch the column address into the DRAM array.
RDY	Output	Ready — This totem-pole output synchronizes memories that are too slow to guarantee microprocessor access time requirements. This output is also used to inhibit access cycles during refresh when in cycle-steal mode.

pin descriptions (continued)

TWST	Input	Timing/Wait Strap — A high on this input indicates a wait state should be added to each memory cycle. In addition it is used in conjunction with FS0 and FS1 to determine refresh rate and timing or initialize the controller.
FS0, FS1	Inputs	Frequency Select 0; Frequency Select 1 — These are strap inputs to select Mode and Frequency of operation as shown in Table 1.
$\overline{\text{RESET}}$[†]	Input	$\overline{\text{RESET}}$ — Active-low input to initialize the controller asynchronously. Refresh Address is set to IFF_{16}, internal refresh requests, synchronizer, and frequency divider are cleared. (Note: $\overline{\text{RESET}}$ contains an internal pullup resistor with a nominal resistance of 100 kΩ, which allows this pin to be left open.)

[†] This function is available only in the FK and FN packages.

TABLE 1. STRAP CONFIGURATION

STRAP INPUT MODES			WAIT STATES FOR MEMORY ACCESS	REFRESH RATE	MINIMUM CLOCK FREQUENCY (MHz)	REFRESH FREQUENCY (kHz)	CLOCK CYCLES FOR EACH REFRESH
TWST	FS1	FS0					
L	L	L[†]	0	EXTERNAL	–	REFREQ	4
L	L	H	0	EXTERNAL	–	REFREQ	3
L	H	L	0	CLK ÷ 61	3.904	64-95[‡]	3
L	H	H	0	CLK ÷ 91	5.824	64-88[§]	4
H	L	L	1	CLK ÷ 61	3.904	64-95[‡]	3
H	L	H	1	CLK ÷ 91	5.824	64-75[‡]	4
H	H	L	1	CLK ÷ 106	6.784	64-73[‡]	4
H	H	H	1	CLK ÷ 121	7.744	64-83[¶]	4

[†] This strap configuration resets the Refresh Timer Circuitry.

[‡] Upper figure in refresh frequency is the frequency that is produced if the minimum clock frequency of the next select state is used.

[§] Refresh frequency if clock frequency is 8 MHz.

[¶] Refresh frequency if clock frequency is 10 MHz.

TABLE 2. OUTPUT STROBE SELECTION

CONTROL INPUT		SELECTED OUTPUT					
REN1	REN0	$\overline{\text{RAS0}}$	$\overline{\text{RAS1}}$	$\overline{\text{RAS2}}$	$\overline{\text{RAS3}}$	$\overline{\text{CAS0}}$	$\overline{\text{CAS1}}$
L	L	X				X	
L	H		X			X	
H	L			X			X
H	H				X		X

NOTE: Changing the logic value of REN1 after a low-to-high transition of ALE and before $\overline{\text{ACX}}$ rises causes the other $\overline{\text{CAS}}$ to fall. Both $\overline{\text{CAS}}$ signals remain low until $\overline{\text{ACX}}$ rises.

functional description

The THCT4502 consists of six basic blocks: address and select latches, refresh rate generator, refresh counter, the multiplexer, the arbiter, and the timing and control block.

address and select latches

The address and select latches allow the DRAM controller to be used in systems that multiplex address and data on the same lines without external latches. The row address latches are transparent, meaning that while ALE is high, the output at MA0-MA8 follows the inputs RA0-RA8.

refresh rate generator

The refresh rate generator is a counter that indicates to the arbiter that it is time for a refresh cycle. The counter divides the clock frequency according to the configuration straps as shown in Table 1. The counter is reset when a refresh cycle is requested or when TWST, FS1, and FS0 are low. The configuration straps allow the matching of memories to the system access time. Upon power-up it is necessary to provide a reset signal by driving all three straps to the controller (or $\overline{\text{RESET}}$ for devices in the FK and FN packages only) low. A systems power-on reset ($\overline{\text{RESET}}$) can be used to do this by connecting it to those straps that are desired high during operation. During this reset period, at least four clock cycles should occur.

refresh counter

The refresh counter contains the address of the row to be refreshed. The counter is decremented after each refresh cycle. A low-to-high transition on TWST sets the refresh counter to $1FF_{16}$ (511_{10}).

multiplexer

The multiplexer provides the DRAM array with row, column, and refresh addresses at the proper times. Its inputs are the address latches and the refresh counter. The outputs provide up to 18 multiplexed addresses on nine lines.

arbiter

The arbiter provides two operational cycles: access and refresh. The arbiter resolves conflicts between cycle requests and cycles in execution, and schedules the inhibited cycle when used in cycle-steal mode.

timing and control block

The timing and control block executes the operational cycle at the request of the arbiter. It provides the DRAM array with $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ signals. It provides the CPU with a RDY signal. It controls the multiplexer during all cycles. It resets the refresh rate generator and decrements the refresh counter during refresh cycles.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)[†]

Supply voltage range, V_{CC} (See Note 1)	−1.5 V to 7 V
Input diode current, I_{IK} ($V_I < 0$, $V_I > V_{CC}$)	±20 mA
Output diode current, I_{OK} ($V_O < 0$, $V_O > V_{CC}$)	±20 mA
Continuous output current, I_O ($V_O = 0$ to V_{CC})	±35 mA
Continuous current through V_{CC} or GND pins	±70 mA
Operating free-air temperature range	0 °C to 70 °C
Storage temperature range	−65 °C to 150 °C
Lead temperature 1,6 mm (1/16 inch) from case for 60 seconds: FK or JD package	300 °C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds: FN or N package	260 °C

[†] Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the "Recommended Operating Conditions" section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: Voltage values are with respect to network ground.

recommended operating conditions

		MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage	4.5	5	5.5	V
V_{IH}	High-level input voltage	2		$V_{CC}+0.5$	V
V_{IL}	Low-level input voltage	-0.5†		0.8	V
V_O	Output voltage	-0.5		$V_{CC}+0.5$	V
t_t	Input transition (rise and fall) time	0		500	ns
T_A	Operating free-air temperature	0		70	°C

† The algebraic convention, where the more negative (less positive) limit is designated as minimum, is used in this data sheet for logic voltage levels only.

$t_{ACH\text{-}CL}$	Time delay, $\overline{\text{ACX}}$ high to CLK low (see Notes 3 and 7)	30		ns
$t_{ACL\text{-}CH}$	Time delay, $\overline{\text{ACX}}$ low to CLK starting high (to remove RDY)	30		ns
$t_{RQL\text{-}CL}$	Time delay, $\overline{\text{REFREQ}}$ low to CLK starting low (see Note 8)	35		ns
$t_{w(RQL)}$	Pulse width $\overline{\text{REFREQ}}$ low	30		ns
$t_{w(ACL)}$	$\overline{\text{ACX}}$ low width (see Note 9)	120		ns
t_{reset}	Power-up reset	$4t_{cCLK}$		ns

NOTES:
1. Coincidence of the trailing edge of CLK and the trailing edge of ALE should be avoided as the refresh/access occurs on the trailing CLK edge.
2. If ALE rises before $\overline{\text{ACX}}$ and a refresh request is present, the falling edge of CLK after $t_{CL\text{-}AEH}$ will output the refresh address to MA0-MA7 and initiate a refresh cycle.
3. These specifications relate to system timing and do not directly reflect device performance.
4. On the access grant cycle following refresh, the occurrence of $\overline{\text{CAS}}$ low depends on the relative occurrence of ALE low to $\overline{\text{ACX}}$ low. If $\overline{\text{ACX}}$ occurs prior to or coincident with ALE, then $\overline{\text{CAS}}$ is timed from the CLK high transition that causes $\overline{\text{RAS}}$ low. If $\overline{\text{ACX}}$ occurs 20 ns or more after ALE, then $\overline{\text{CAS}}$ is timed from the CLK low transition following the CLK high transition causing $\overline{\text{RAS}}$ low.
5. For maximum speed access (internal delays on both access and access grant cycles), $\overline{\text{ACX}}$ should occur prior to or coincident with ALE.
6. $t_{h(RA)}$ is the dynamic memory row address hold time. $\overline{\text{ACX}}$ should follow ALE by $t_{AEL\text{-}CEL}$ in systems where the required $t_{h(RA)}$ is greater than $t_{REL\text{-}MAX}$ minimum.
7. The minimum of 20 ns is specified to ensure arbitration will occur on falling CLK edge, $t_{ACH\text{-}CL}$ also affects precharge time such that the minimum $t_{ACH\text{-}CL}$ should be equal or greater than: $t_{w(RH)} - t_{w(CL)} + 30$ ns (for a cycle where $\overline{\text{ACX}}$ high occurs prior to ALE high) where $t_{w(RH)}$ is the DRAM $\overline{\text{RAS}}$ precharge time.
8. This parameter is necessary only if refresh arbitration is to occur on this low-going CLK edge (in systems where refresh is synchronized to external events).
9. The specification $t_{w(ACL)}$ is designed to allow a $\overline{\text{CAS}}$ pulse. This assures normal operation of the device in testing and system operation.

switching characteristics over recommended supply voltage range and operating free-air temperature range (see Figure 1)

PARAMETER		TEST CONDITIONS	THCT4502-125		UNIT
			MIN	MAX	
$t_{AEL\text{-}REL}$	Time delay, ALE low to $\overline{RAS}$ starting low	C_L = 180 pF		45	ns
$t_{RAV\text{-}MAV}$	Time delay, row address valid to memory address valid	C_L = 360 pF		50	ns
$t_{AEH\text{-}MAV}$	Time delay, ALE high to valid memory address	C_L = 360 pF		90	ns
$t_{AEL\text{-}RYL}$	Time delay, ALE to RDY starting low (TWST = 1 or refresh in progress)	C_L = 40 pF		40	ns
$t_{AEL\text{-}CEL}$	Time delay, ALE low to $\overline{CAS}$ starting low (see Note 10)	C_L = 360 pF	50	125	ns
$t_{AEH\text{-}REH}$	Time delay, ALE high to $\overline{RAS}$ starting high	C_L = 180 pF		50	ns
$t_{ACL\text{-}MAX}$	Row address valid after $\overline{ACX}$	C_L = 360 pF	15		ns
$t_{MAV\text{-}CEL}$	Time delay, memory address valid to $\overline{CAS}$ starting low	C_L = 360 pF	0		ns
$t_{ACL\text{-}CEL}$	Time delay, $\overline{ACX}$ low to $\overline{CAS}$ starting low (see Note 10)	C_L = 360 pF	40	100	ns
$t_{ACH\text{-}REH}$	Time delay, $\overline{ACX}$ to $\overline{RAS}$ starting high	C_L = 180 pF		55	ns
$t_{ACH\text{-}CEH}$	Time delay, $\overline{ACX}$ high to $\overline{CAS}$ starting high	C_L = 360 pF	5	45	ns
$t_{ACH\text{-}MAX}$	Column address valid after $\overline{ACX}$ high	C_L = 360 pF	10		ns
$t_{CH\text{-}RYH}$	Time delay, CLK high to RDY starting high (after $\overline{ACX}$ low) (see Note 11)	C_L = 40 pF		60	ns
$t_{RFL\text{-}RFL}$	Time delay, $\overline{REFREQ}$ external till supported by $\overline{REFREQ}$ internal	C_L = 40 pF		35	ns
$t_{CH\text{-}RFL}$	Time delay, CLK high till $\overline{REFREQ}$ internal starting low	C_L = 40 pF		50	ns
$t_{CL\text{-}MAV}$	Time delay, CLK low till refrefresh address valid	C_L = 360 pF		100	ns
$t_{CH\text{-}RRL}$	Time delay, CLK high till refresh $\overline{RAS}$ starting low	C_L = 180 pF	10	60	ns
$t_{MAV\text{-}RRL}$	Time delay, refresh address valid till refresh $\overline{RAS}$ low	C_L = 180 pF	5		ns
$t_{CL\text{-}RFH}$	Time delay, CLK low to $\overline{REFREQ}$ starting high (3 cycle refresh)	C_L = 40 pF		70	ns
$t_{CH\text{-}RFH}$	Time delay, CLK high to $\overline{REFREQ}$ starting high (4 cycle refresh)	C_L = 40 pF		70	ns
$t_{CH\text{-}RRH}$	Time delay, CLK high to refresh $\overline{RAS}$ starting high	C_L = 160 pF	5	60	ns
$t_{CH\text{-}MAX}$	Refresh address valid after CLK high	C_L = 360 pF	10		ns

NOTES: 10. The falling edge of $\overline{CAS}$ occurs when both ALE low to $\overline{CAS}$ low time delay ($t_{AEL\text{-}CEL}$) and $\overline{ACX}$ low to $\overline{CAS}$ low time delay ($t_{ACL\text{-}CEL}$) have elapsed, i.e., if $\overline{ACX}$ goes low prior to ($t_{AEL\text{-}CEL} - t_{ACL\text{-}CEL}$) after the falling edge of ALE, the falling edge of $\overline{CAS}$ is measured from the falling edge of ALE ($t_{AEL\text{-}CEL}$). Otherwise, the access time increases and the falling edge of $\overline{CAS}$ is measured from the falling edge of $\overline{ACX}$ ($t_{ACL\text{-}CEL}$).

11. RDY returns high on the rising edge of CLK. If TWST = 0, then on an access grant cycle RDY goes high on the same edge that causes access $\overline{RAS}$ low. If TWST = 1, then RDY goes to the high level on the first rising CLK edge after $\overline{ACX}$ goes low on access cycles and on the next rising edge after the edge that causes access $\overline{RAS}$ low on access grant cycles (assuming $\overline{ACX}$ low).

switching characteristics over recommended supply voltage range and operating free-air temperature range (see Figure 1) (continued)

PARAMETER		TEST CONDITIONS	THCT4502-125		UNIT
			MIN	MAX	
$t_{CH\text{-}REL}$	Time delay, CLK high till access $\overline{RAS}$ starting low	C_L = 180 pF		60	ns
$t_{CL\text{-}CEL}$	Time delay, CLK low to access $\overline{CAS}$ starting low (see Note 12)	C_L = 360 pF		100	ns
$t_{CL\text{-}MAX}$	Row address valid after CLK low	C_L = 360 pF	25		ns
$t_{REL\text{-}MAX}$	Row address valid after $\overline{RAS}$ low	C_L = 360 pF	25		ns
$t_{AEH\text{-}MAX}$	Column address valid after ALE high	C_L = 360 pF	10		ns
t_{dis}	Output disable time (3-state outputs)	C_L = 360 pF		125	ns
t_{en}	Output enable time (3-state outputs)	C_L = 360 pF		75	ns
$t_{CAV\text{-}CEL}$	Time delay, column address valid to $\overline{CAS}$ starting low after refresh (see Note 12)	C_L = 360 pF	0		ns
$t_{CH\text{-}CEL}$	Time delay, CLK high to access $\overline{CAS}$ starting low (see Note 13)	C_L = 360 pF		180	ns
$t_{t(CEL)}$	$\overline{CAS}$ fall time	C_L = 360 pF		20	ns
$t_{t(CEH)}$	$\overline{CAS}$ rise time	C_L = 360 pF		50	ns
$t_{t(REL)}$	$\overline{RAS}$ fall time	C_L = 180 pF		30	ns
$t_{t(REH)}$	$\overline{RAS}$ rise time	C_L = 180 pF		40	ns
$t_{t(MAV)}$	Address transition time	C_L = 180 pF		40	ns
$t_{t(RYL)}$	RDY fall time	C_L = 40 pF		20	ns
$t_{t(RYH)}$	RDY rise time	C_L = 40 pF		50	ns

NOTES: 12. The occurrence of $\overline{CAS}$ low is guaranteed not to occur until the column address is valid on MAX.

13. On the access grant cycle following refresh, the occurrence of $\overline{CAS}$ low depends on the relative occurrence of ALE low to $\overline{ACX}$ low. If $\overline{ACX}$ occurs prior to or coincident with ALE then $\overline{CAS}$ is timed from the CLK high transition that causes $\overline{RAS}$ low. If $\overline{ACX}$ occurs 20 ns or more after ALE then $\overline{CAS}$ is timed from the CLK low transition following the CLK high transition causing $\overline{RAS}$ low. (See Refresh Cycle Timing Diagram)

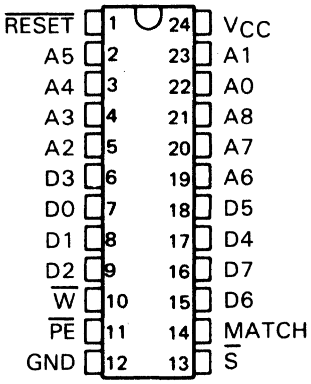
CACHE ADDRESS COMPARATOR

D2911, MARCH 1982—REVISED SEPTEMBER 1985

- **Fast Address to Match Valid Delay — Three Speed Ranges: 35 ns, 45 ns, 55 ns**
- **512 × 9 Internal RAM**
- **300-Mil 24-Pin Ceramic Side-Brazed or Plastic Dual-In-Line or Small Outline Packages**
- **Max Power Dissipation: 660 mW**
- **On-Chip Parity Generation and Checking**
- **Parity Error Output/Force Parity Error Input**
- **On-Chip Address/Data Comparator**
- **Asynchronous, Single-Cycle Reset**
- **Easily Expandable**
- **Fully Static**
- **Reliable SMOS (Scaled NMOS) Technology**
- **TTL- and CMOS-Compatible Inputs and Outputs**

DW, JD, OR NT PACKAGE
(TOP VIEW)



description

This 8-bit-slice cache address comparator consists of a high-speed 512 × 9 static RAM array, parity generator, parity checker, and 9-bit high-speed comparator. It is fabricated using N-channel silicon gate technology for high speed and simple interface with MOS and bipolar TTL circuits. The cache address comparator is easily cascadable for wider tag addresses or deeper tag memories. Significant reductions in cache memory component count, board area, and power dissipation can be achieved with this device.

When $\overline{\text{S}}$ is low and $\overline{\text{W}}$ is high, the cache address comparator compares the contents of the memory location addressed by A0-A8 with the data on D0-D7 plus generated parity. An equality is indicated by a high level on the MATCH output. A low-level output from $\overline{\text{PE}}$ signifies a parity error in the internal RAM data. $\overline{\text{PE}}$ is an N-channel open-drain output for easy OR-tying. During a write cycle ($\overline{\text{S}}$ and $\overline{\text{W}}$ low), data on D0-D7 plus generated even parity are written in the 9-bit memory location addressed by A0-A8. Also during write, a parity error may be forced by holding $\overline{\text{PE}}$ low.

A $\overline{\text{RESET}}$ input is provided for initialization. When $\overline{\text{RESET}}$ goes low, all 512 × 9 RAM locations are cleared and the MATCH output is forced high.

The cache address comparator operates from a single +5 V supply and is offered in a 24-pin 300-mil ceramic side brazed or plastic dual-in-line packages. The device is fully TTL compatible and is characterized for operation from 0 °C to 70 °C.

MATCH OUTPUT DESCRIPTION

MATCH = V_{OH} if: [A0-A8] = D0-D7 + parity,
or: $\overline{\text{RESET}} = V_{IL}$,
or: $\overline{\text{S}} = V_{IH}$,
or: $\overline{\text{W}} = V_{IL}$

MATCH = V_{OL} if: [A0-A8] $\neq$ D0-D7 + parity,
with $\overline{\text{RESET}} = V_{IH}$,
$\overline{\text{S}} = V_{IL}$, and $\overline{\text{W}} = V_{IH}$

FUNCTION TABLE

OUTPUT		FUNCTION DESCRIPTION
MATCH	$\overline{\text{PE}}$	
L	L	Parity Error
L	H	Not Equal
H	L	Undefined Error
H	H	Equal

Where S = V_{IL}, W = V_{IH}, RESET = V_{IH}

PIN FUNCTIONAL DESCRIPTION

PIN		DESCRIPTION
NAME	NO.	
$\overline{\text{RESET}}$	1	$\overline{\text{RESET}}$ input. Asynchronously clears entire RAM array and forces MATCH high when $\overline{\text{RESET}}$ is at V_{IL} and $\overline{\text{W}}$ is at V_{IH}.
A0 A1 A2 A3 A4 A5 A6 A7 A8	22 23 5 4 3 2 19 20 21	Address inputs. Address 1 of 512-by-9-bit random-access memory locations. Must be stable for the duration of the write cycle.
D0 D1 D2 D3 D4 D5 D6 D7	7 8 9 6 17 18 15 16	Data inputs. Compared with memory location addressed by A0-A8 when $\overline{\text{W}}$ is at V_{IH} and $\overline{\text{S}}$ is at V_{IL}. Provide input data to RAM when $\overline{\text{W}}$ is at V_{IL} and $\overline{\text{S}}$ is at V_{IL}.
$\overline{\text{W}}$	10	Write control input. Writes D0 through D7 and generated parity into RAM and forces MATCH high when $\overline{\text{W}}$ is at V_{IL} and $\overline{\text{S}}$ is at V_{IL}. Places selected device in compare mode if $\overline{\text{W}}$ is at V_{IH}.
$\overline{\text{PE}}$	11	Parity error input/output. During write cycles, $\overline{\text{PE}}$ can force a parity error into the 9-bit location specified by A0 through A8 when $\overline{\text{PE}}$ is at V_{IL}. For compare cycles, $\overline{\text{PE}}$ at V_{OL} indicates a parity error in the stored data. $\overline{\text{PE}}$ is an open-drain output so an external pull-up resistor is required.
GND	12	Ground
$\overline{\text{S}}$	13	Chip select input. Enables device when $\overline{\text{S}}$ is at V_{IL}. Deselects device and forces MATCH high when $\overline{\text{S}}$ is at V_{IH}.
MATCH	14	When MATCH output is at V_{OH} during a compare cycle, D0 through D7 plus parity equal the contents of the 9-bit memory location addressed by A0 through A8.
V_{CC}	24	5-V supply voltage

absolute maximum ratings over operating free-air temperature range (unless otherwise specified)

Supply voltage range, V_{CC} (see Note 1)	−1.5 to 7 V
Input voltage range, any input	−1.5 to 7 V
Continuous power dissipation	1 W
Operating free-air temperature range	0°C to 70°C
Storage temperature range	−65°C to 150°C

NOTE 1: All voltage values are with respect to GND.

recommended operating conditions

PARAMETER	MIN	NOM	MAX	UNIT
Supply voltage, V_{CC}	4.5	5	5.5	V
High-level input voltage, V_{IH}	2		6	V

TMS4500A
DYNAMIC RAM CONTROLLER

JANUARY 1982—REVISED APRIL 1985

- Control Operation of 8K/16K/32K/64K Dynamic RAMs
- Creates Static RAM Appearance
- One Package Contains Address Multiplexer, Refresh Control, and Timing Control
- Directly Addresses and Drives Up to 256K Bytes of Memory Without External Drivers
- Operates from Microprocessor Clock
  - — No Crystals, Delay Lines, or RC Networks
  - — Eliminates Arbitration Delays
- Refresh May Be Internally or Externally Initiated
- Versatile
  - — Strap-Selected Refresh Rate
  - — Synchronous, Predictable Refresh
  - — Selection of Distributed, Transparent, and Cycle-Steal Refresh Modes
  - — Interfaces Easily to Popular Microprocessors
- Strap-Selected Wait State Generation for Microprocessor/Memory Speed Matching
- Ability to Synchronize or Interleave Controller with the Microprocessor System (including Multiple Controllers)
- Three-State Outputs Allow Multiport Memory Configuration
- Performance Ranges of 150, 200, or 250 ns

description

The TMS4500A is a monolithic DRAM system controller designed to provide address multiplexing, timing, control and refresh/access arbitration functions to simplify the interface of dynamic RAMs to microprocessor systems.

The controller contains a 16-bit multiplexer that generates the address lines for the memory device from the 16 system address bits and provides the strobe signals required by the memory to decode the address. An 8-bit refresh counter generates the 256-row addresses required for refresh.

A refresh timer is provided that generates the necessary timing to refresh the dynamic memories and assure data retention.

The TMS4500A also contains refresh/access arbitration circuitry to resolve conflicts between memory access requests and memory refresh cycles. The TMS4500A is offered in a 40-pin, 600-mil dual-in-line plastic package and 44-pin, 650-mil square plastic chip carrier package. It is guaranteed for operation from 0 °C to 70 °C.

pin descriptions

RA0 - RA7	Input	Row Address — These address inputs are used to generate the row address for the multiplexer.
CA0 - CA7	Input	Column Address — These address inputs are used to generate the column address for the multiplexer.
MA0 - MA7	Output	Memory Address — These three-state outputs are designed to drive the addresses of the dynamic RAM array.
ALE	Input	Address Latch Enable — This input is used to latch the 16 address inputs, $\overline{CS}$ and REN1. This also initiates an access cycle if chip select is valid. The rising edge (low level to high level) of ALE returns $\overline{RAS}$ to the high level.

pin descriptions (continued)

$\overline{\text{CS}}$	Input	Chip Select — A low on this input enables an access cycle. The trailing edge of ALE latches the chip select input.
REN1	Input	RAS Enable 1 — This input is used to select one of two banks of RAM via the $\overline{\text{RAS0}}$ and $\overline{\text{RAS1}}$ outputs when chip select is present. When it is low, $\overline{\text{RAS0}}$ is selected; when it is high, $\overline{\text{RAS1}}$ is selected.
$\overline{\text{ACR}}$, $\overline{\text{ACW}}$	Input	Access Control, Read; Access Control, Write — A low on either of these inputs causes the column address to appear on MA0 - MA7 and the column address strobe. The rising edge of $\overline{\text{ACR}}$ or $\overline{\text{ACW}}$ terminates the cycle by ending $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ strobes. When $\overline{\text{ACR}}$ and $\overline{\text{ACW}}$ are both low, MA0 - MA7, $\overline{\text{RAS0}}$, $\overline{\text{RAS1}}$, and $\overline{\text{CAS}}$ go into a high-impedance (floating) state.
CLK	Input	System Clock — This input provides the master timing to generate refresh cycle timings and refresh rate. Refresh rate is determined by the TWST, FS1, FS0 inputs.
$\overline{\text{REFREQ}}$	Input/Output	Refresh Request — (This input should be driven by an open-collector output.) On input, a low-going edge initiates a refresh cycle and will cause the internal refresh timer to be reset on the next falling edge of the CLK. As an output, a low-going edge signals an internal refresh request and that the refresh timer will be reset on the next low-going edge of CLK. $\overline{\text{REFREQ}}$ will remain low until the refresh cycle is in progress and the current refresh address is present on MA0-MA7. (Note: $\overline{\text{REFREQ}}$ contains an internal pull-up resistor with a nominal resistance of 10 kilohms.)
$\overline{\text{RAS0}}$, $\overline{\text{RAS1}}$	Output	Row Address Strobe — These three-state outputs are used to latch the row address into the bank of DRAMs selected by REN1. On refresh both signals are driven.
$\overline{\text{CAS}}$	Output	Column Address Strobe — This three-state output is used to latch the column address into the DRAM array.
RDY	Output	Ready — This totem-pole output synchronizes memories that are too slow to guarantee microprocessor access time requirements. This output is also used to inhibit access cycles during refresh when in cycle-steal mode.
TWST	Input	Timing/Wait Strap — A high on this input indicates a wait state should be added to each memory cycle. In addition it is used in conjunction with FS0 and FS1 to determine refresh rate and timing.
FS0, FS1	Input	Frequency Select 0; Frequency Select 1 — These are strap inputs to select Mode and Frequency of operation as shown in Table 1.

TABLE 1 – STRAP CONFIGURATION

STRAP INPUT MODES			WAIT STATES FOR MEMORY ACCESS	REFRESH RATE	MINIMUM CLK FREQ. (MHz)	REFRESH FREQ. (kHz)	CLOCK CYCLES FOR EACH REFRESH
TWST	FS1	FS0					
L	L	L[†]	0	EXTERNAL	–	REFREQ	4
L	L	H	0	CLK ÷ 31	1.984	64 - 95[‡]	3
L	H	L	0	CLK ÷ 46	2.944	64 - 85[‡]	3
L	H	H	0	CLK ÷ 61	3.904	64 - 82[§]	4
H	L	L	1	CLK ÷ 46	2.944	64 - 85[‡]	3
H	L	H	1	CLK ÷ 61	3.904	64 - 80[‡]	4
H	H	L	1	CLK ÷ 76	4.864	64 - 77[‡]	4
H	H	H	1	CLK ÷ 91	5.824	64 - 88[¶]	4

[†] This strap configuration resets the Refresh Timer circuitry.

[‡] Upper figure in refresh frequency is the frequency that is produced if the minimum CLK frequency of the next select state is used.

[§] Refresh frequency if CLK frequency is 5 MHz.

[¶] Refresh frequency if CLK frequency is 8 MHz.

functional description

TMS4500A consists of six basic blocks; address and select latches, refresh rate generator, refresh counter, the multiplexer, the arbiter, and the timing and control block.

address and select latches

The address and select latches allow the DRAM controller to be used in systems that multiplex address and data on the same lines without external latches. The row address latches are transparent, meaning that while ALE is high, the output at MA0 - MA7 follows the inputs RA0 - RA7.

refresh rate generator

The refresh rate generator is a counter that indicates to the arbiter that it is time for a refresh cycle. The counter divides the clock frequency according to the configuration straps as shown in Table 1. The counter is reset when a refresh cycle is requested or when TWST, FS1 and FS0 are low. The configuration straps allow the matching of memories to the system access time.

Upon Power-Up it is necessary to provide a reset signal by driving all three straps to the controller low to initialize internal counters. A system's low-active, power-on reset ($\overline{\text{RESET}}$) can be used to accomplish this by connecting it to those straps that are desired high during operation. During this reset period, at least four clock cycles should occur.

refresh counter

The refresh counter contains the address of the row to be refreshed. The counter is decremented after each refresh cycle. [A low-to-high transition on TWST sets the refresh counter to FF_{16} (255_{10}).]

multiplexer

The multiplexer provides the DRAM array with row, column, and refresh addresses at the proper times. Its inputs are the address latches and the refresh counter. The outputs provide up to 16 multiplexed addresses on eight lines.

arbiter

The arbiter provides two operational cycles: access and refresh. The arbiter resolves conflicts between cycle requests and cycles in execution, and schedules the inhibited cycle when used in cycle-steal mode.

timing and control block

The timing and control block executes the operational cycle at the request of the arbiter. It provides the DRAM array with $\overline{RAS}$ and $\overline{CAS}$ signals. It provides the CPU with a RDY signal. It controls the multiplexer during all cycles. It resets the refresh rate generator and decrements the refresh counter during refresh cycles.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)[†]

Supply voltage range, V_{CC} (see Note 1)	−1.5 to 7 V
Input voltage range (any input)	−1.5 V to 7 V
Continuous power dissipation	1.2 W
Operating free-air temperature range	0°C to 70°C
Storage temperature range	−65°C to 150°C

[†] Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the "Recommended Operating Conditions" section of this specification is not implied. Exposure to absolute maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: Voltage values are with respect to the ground terminal.

recommended operating conditions

PARAMETER	MIN	NOM	MAX	UNIT
Supply voltage, V_{CC}	4.5	5	5.5	V
High-level input voltage, V_{IH}	2.4		6	V
Low-level input voltage, V_{IL}	−1[‡]		0.8	V
High-level output current, I_{OH}			−1	mA
Low-level output current, I_{OL}			4	mA
Short-circuit output current, I_{OS}[§]			−50	mA
Operating free-air temperature, T_A	0		70	°C

[‡] The algebraic convention, where the less-positive (more-negative) limit is designated as minimum, is used in this data sheet for logic voltage levels only.

[§] Not more than one output should be shorted at a time.

electrical characteristics over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER			TEST CONDITIONS		MIN	TYP[¶]	MAX	UNIT
V_{OH}	High-level output voltage	MA0-MA7, RDY	I_{OH} = −1 mA	V_{CC} = 4.5 V	2.4			V
		$\overline{RAS0}$, $\overline{RAS1}$, $\overline{CAS}$			2.7			
		$\overline{REFREQ}$	I_{OH} = −100 μA	V_{CC} = 4.5 V	2.4			
V_{OL}	Low-level output voltage		I_{OL} = 4 mA	V_{CC} = 4.5 V			0.4	V
I_{IH}	High-level input current except $\overline{REFREQ}$		V_I = 5.5 V				10	μA
I_{IL}	Low-level input current	$\overline{REFREQ}$	V_I = 0 V				−1.25	mA
		All others					−10	μA
I_{OZ}	Off-state output current		V_O = 0 to 4.5 V	V_{CC} = 5.5 V			±50	μA
I_{CC}	Operating supply current		T_A = 0°C			100	140	mA
C_i	Input capacitance		V_I = 0 V,	f = 1 MHz		5		pF
C_o	Output capacitance		V_O = 0 V,	f = 1 MHz		6		pF

[¶] All typical values are at V_{CC} = 5 V, T_A = 25°C.

timing requirements over recommended supply voltage range and operating free-air temperature range

PARAMETER		TMS4500A-15		TMS4500A-20		TMS4500A-25		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	
$t_{c(C)}$	CLK cycle time	100		120		140		ns
$t_{w(CH)}$	CLK high pulse width	40		40		40		
$t_{w(CL)}$	CLK low pulse width	40		45		45		
t_t	Transition time, all inputs		50		50		50	
$t_{AEL\text{-}CL}$	Time delay, ALE low to CLK starting low (see Note 1)	10		10		15		
$t_{CL\text{-}AEL}$	Time delay, CLK low to ALE starting low (see Note 1)	10		10		15		
$t_{CL\text{-}AEH}$	Time delay, CLK low to ALE starting high (see Note 2)	15		20		20		
$t_{w(AEH)}$	Pulse width ALE high	50		60		60		
$t_{AV\text{-}AEL}$	Time delay, address, REN1, $\overline{\text{CS}}$ valid to ALE low	5		10		15		
$t_{AEL\text{-}AX}$	Time delay, ALE low to address not valid	10		10		10		
$t_{AEL\text{-}ACL}$	Time delay, ALE low to $\overline{\text{ACX}}$ low (see Notes 3,4,5, and 6)	$t_{h(RA)} + 30$		$t_{h(RA)} + 40$		$t_{h(RA)} + 50$		
$t_{ACH\text{-}CL}$	Time delay, $\overline{\text{ACX}}$ high to CLK low (see Notes 3 and 7)	20		20		20		
$t_{ACL\text{-}CH}$	Time delay, $\overline{\text{ACX}}$ low to CLK starting high (to remove RDY)	30		30		30		
$t_{RQL\text{-}CL}$	Time delay, $\overline{\text{REFREQ}}$ low to CLK starting low (see Note 8)	20		20		20		
$t_{w(RQL)}$	Pulse width, $\overline{\text{REFREQ}}$ low	20		20		20		
$t_{w(ACL)}$	$\overline{\text{ACX}}$ low width (see Note 9)	110		140		175		

NOTES:
1. Coincidence of the trailing edge of CLK and the trailing edge of ALE should be avoided, as the refresh/access occurs on the trailing CLK edge. A trailing edge of CLK should occur during the interval from $\overline{\text{ACX}}$ high to ALE low.
2. If ALE rises before $\overline{\text{ACX}}$ and a refresh request is present, the falling edge of CLK after $t_{CL\text{-}AEH}$ will output the refresh address to MA0-MA7 and initiate a refresh cycle.
3. These specifications relate to system timing and do not directly reflect device performance.
4. On the access grant cycle following refresh, the occurrence of $\overline{\text{CAS}}$ low depends on the relative occurrence of ALE low to $\overline{\text{ACX}}$ low. If $\overline{\text{ACX}}$ occurs prior to or coincident with ALE then $\overline{\text{CAS}}$ is timed from the CLK high transition that causes $\overline{\text{RAS}}$ low. If $\overline{\text{ACX}}$ occurs 20 ns or more after ALE then $\overline{\text{CAS}}$ is timed from the CLK low transition following the CLK high transition causing $\overline{\text{RAS}}$ low.
5. For maximum speed access (internal delays on both access and access grant cycles), $\overline{\text{ACX}}$ should occur prior to or coincident with ALE.
6. $t_{h(RA)}$ is the dynamic memory row address hold time. $\overline{\text{ACX}}$ should follow ALE by $t_{AEL\text{-}CEL}$ in systems where the required $t_{h(RA)}$ is greater than $t_{REL\text{-}MAX}$ minimum.
7. Minimum of 20 ns is specified to ensure arbitration will occur on falling CLK edge. $t_{ACH\text{-}CL}$ also affects precharge time such that the minimum $t_{ACH\text{-}CL}$ should be equal or greater than: $t_{w(RH)} - t_{w(CL)} + 30$ ns (for cycle where $\overline{\text{ACX}}$ high occurs prior to ALE high) where $t_{w(RH)}$ is the DRAM $\overline{\text{RAS}}$ precharge time.
8. This parameter is necessary only if refresh arbitration is to occur on this low-going CLK edge (in systems where refresh is synchronized to external events).
9. The specification of $t_{w(ACL)}$ is designed to allow a CAS pulse. This assures normal operation of the device in testing and system operation.

switching characteristics over recommended supply voltage range and operating free-air temperature range (see Figure 1)

PARAMETER		TEST CONDITIONS	TMS4500A-15		TMS4500A-20		TMS4500A-25		UNIT
			MIN	MAX	MIN	MAX	MIN	MAX	
$t_{AEL\text{-}REL}$	Time delay, ALE low to $\overline{\text{RAS}}$ starting low	C_L = 160 pF		35		40		50	ns
$t_{RAV\text{-}MAV}$	Time delay, row address valid to memory address valid			45		50		60	
$t_{AEH\text{-}MAV}$	Time delay, ALE high to valid memory address			65		75		90	
$t_{AEL\text{-}RYL}$	Time delay, ALE to RDY starting low (TWST = 1 or refresh in progress)	C_L = 40 pF		40		40		40	
$t_{AEL\text{-}CEL}$	Time delay, ALE low to $\overline{\text{CAS}}$ starting low (see Note 10)	C_L = 160 pF	60	150	70	200	80	250	
$t_{AEH\text{-}REH}$	Time delay, ALE high to $\overline{\text{RAS}}$ starting high			30		30		40	
$t_{ACL\text{-}MAX}$	Row address valid after $\overline{\text{ACX}}$ low		15		20		25		
$t_{MAV\text{-}CEL}$	Time delay, memory address valid to $\overline{\text{CAS}}$ starting low		0		0		0		
$t_{ACL\text{-}CEL}$	Time delay, $\overline{\text{ACX}}$ low to $\overline{\text{CAS}}$ starting low (see Note 10)		40	100	45	130	50	165	
$t_{ACH\text{-}REH}$	Time delay, $\overline{\text{ACX}}$ to $\overline{\text{RAS}}$ starting high			30		40		50	
$t_{ACH\text{-}CEH}$	Time delay, $\overline{\text{ACX}}$ high to $\overline{\text{CAS}}$ starting high		5	30	10	40	15	50	
$t_{ACH\text{-}MAX}$	Column address valid after $\overline{\text{ACX}}$ high		10		15		15		
$t_{CH\text{-}RYH}$	Time delay, CLK high to RDY starting high (after $\overline{\text{ACX}}$ low) (see Note 11)	C_L = 40 pF		40		45		60	
$t_{RFL\text{-}RFL}$	Time delay, $\overline{\text{REFREQ}}$ external till supported by $\overline{\text{REFREQ}}$ internal			30		35		35	
$t_{CH\text{-}RFL}$	Time delay, CLK high till $\overline{\text{REFREQ}}$ internal starting low			30		35		45	
$t_{CL\text{-}MAV}$	Time delay, CLK low till refresh address valid	C_L = 160 pF		75		100		125	
$t_{CH\text{-}RRL}$	Time delay, CLK high till refresh $\overline{\text{RAS}}$ starting low		10	50	15	60	20	80	
$t_{MAV\text{-}RRL}$	Time delay, refresh address valid tili refresh $\overline{\text{RAS}}$ low		5		5		5		
$t_{CL\text{-}RFH}$	Time delay, CLK low to $\overline{\text{REFREQ}}$ starting high (3 cycle refresh)			50		55		75	
$t_{CH\text{-}RFH}$	Time delay, CLK high to $\overline{\text{REFREQ}}$ starting high (4 cycle refresh)			50		55		75	
$t_{CH\text{-}RRH}$	Time delay, CLK high to refresh $\overline{\text{RAS}}$ starting high		5	35	10	45	10	60	
$t_{CH\text{-}MAX}$	Refresh address valid after CLK high		15		20		25		

NOTES: 10. The falling edge of $\overline{\text{CAS}}$ occurs when both ALE low to $\overline{\text{CAS}}$ low time delay ($t_{AEL\text{-}CEL}$) and $\overline{\text{ACX}}$ low to $\overline{\text{CAS}}$ low time delay ($t_{ACL\text{-}CEL}$) have elapsed, i.e., if $\overline{\text{ACX}}$ goes low prior to($t_{AEL\text{-}CEL} - t_{ACL\text{-}CEL}$)after the falling edge of ALE, the falling edge of $\overline{\text{CAS}}$ is measured from the falling edge of ALE ($t_{AEL\text{-}CEL}$). Otherwise, the access time increases and the falling edge of $\overline{\text{CAS}}$ is measured from the falling edge of $\overline{\text{ACX}}$ ($t_{ACL\text{-}CEL}$).

11. RDY returns high on the rising edge of CLK. If TWST = 0, then on an access grant cycle RDY goes high on the same edge that causes access $\overline{\text{RAS}}$ low. If TWST = 1, then RDY goes to the high level on the first rising CLK edge after $\overline{\text{ACX}}$ goes low on access cycles and on the next rising edge after the edge that causes access $\overline{\text{RAS}}$ low on access grant cycles (assuming $\overline{\text{ACX}}$ low).

switching characteristics over recommended supply voltage range and operating free-air temperature range (see Figure 1) (continued)

THCT1010-160M, THCT1010-140E, THCT1010-100
16-BIT BY 16-BIT MULTIPLIERS/ACCUMULATORS

D2834, SEPTEMBER 1984—REVISED SEPTEMBER 1985

- 16-Bit by 16-Bit Parallel Multiplication/Accumulation
- 35-Bit-Wide Accumulator
- Inputs are TTL-Voltage Compatible
- Outputs Capable of Driving up to 10 LSTTL Loads
- Single 5-V Power Supply
- Low Power Dissipation . . . 150 mW Typical
- Pin-for-Pin Compatible with TRW TDC1010J (DIP only) and AM29510 (DIP only)
- High-Speed Twin-Well CMOS Process
- Package Options Include Ceramic and Plastic Chip Carriers and DIPs
- Dependable Texas Instruments Quality and Reliability

description

The THCT1010 is a TTL-voltage-compatible, low-power, high-speed 16-bit by 16-bit multiplier/accumulator for digital signal processing, digital filters, fast Fourier transformations, array processing, and microprocessor throughput enhancement. These devices are pin-for-pin equivalent to the TRW TDC1010J but dissipate 20 times less power. The lower power dissipation causes the differences between junction and ambient temperatures to be minimized and, therefore, eliminates the heat-sink requirements and increases reliability. High speed is achieved by using a modified Booth algorithm, a feed-forward carry circuit, and a conditional sum adder that enhances the final adder stage of the multiplier.

The THCT1010 inputs consist of three registers, a 16-bit X input, a 16-bit Y input, and an input control register. The 35-bit output product register consists of a 16-bit most-significant-product (MSP) bus, a 16-bit least-significant-product (LSP) bus that is shared with the 16-bit Y input bus, and a 3-bit extended-product (XTP) bus (PR32 through PR34); see the functional block diagram. The input registers are

independently controlled by CLK X and CLK Y, and the product registers are D-type positive-edge-triggered flip-flops. Separate three-state output enables are provided for each output product register. These, in combination with the independent input clocks, allow operation on a microprocessor bus.

The THCT1010 has a round control (RND) that rounds the product to the 19 most significant bits. The preload control (PREL) is used in conjunction with the output enables to initialize the contents of the output registers. The THCT1010 will perform multiplication and addition, multiplication and subtraction, or straight multiplication depending upon the states of the accumulate control (ACC) and subtractor control (SUB). The TC control provides the capability of formatting the input data to be either two's complement or unsigned magnitude.

The THCT1010-160M is characterized for operation over the full military temperature range of −55 °C to 125 °C. The THCT1010-140E is characterized for operation from −40 °C to 85 °C. The THCT1010-100 is characterized for operation from 0 °C to 70 °C.

PIN		DESCRIPTION
NO.	NAME	
56–64, 1–7	X15 thru X0	X data inputs, X15 is the most-significant bit. The data is loaded into the X register on the rising edge of CLKX.
8–15, 17–24	Y0/PR0 thru Y15/PR15	I/O ports for least significant product (LSP) bits of output product register, input ports for Y data. Y0/PR0 is the least significant bit. The mode is controlled by the PREL and $\overline{\text{OEMS}}$ pins.
25–43	PR16 thru PR34	I/O ports for output product register bits. PR16 through PR31 are the most-significant product (MSP) bits. PR32 through PR34 are the extended product (XTP) bits. The mode is controlled by PREL, $\overline{\text{OELS}}$, $\overline{\text{OEX}}$.
44	CLK PR	Product clock input. On the low-to-high transition, latches the LSP, MSP, and XTP into the output product register.
45	OEMS	Active-low output enable for MSP output product register. When high, causes the PR31 through PR16 outputs to be in the high-impedance state.
46	PREL	Preload control. When high, the output product register's outputs are disabled. When an output enable ($\overline{\text{OELS}}$, $\overline{\text{OEMS}}$, $\overline{\text{OEX}}$) is high, preload data can be entered into the output product register from the PR I/O lines on the rising edge of CLK PR.
47	$\overline{\text{OEX}}$	Active-low output enable for XTP output product register. When high, causes the PR32 through PR34 outputs to be in the high-impedance state.
48	TC	Two's complement control. When TC is high, the input data is in two's complement format. When TC is low, the input data is in unsigned magnitude format. The TC signal is loaded into the control register on the rising edge of CLK X or CLK Y.
50	CLK Y	Y clock input. On the low-to-high transition, clocks data in from the Y inputs.
51	CLK X	X clock input. On the low-to-high transition, clocks data in from the X inputs.
52	ACC	Accumulator control. When ACC is high and SUB is low, the content of the output product register is added to the next product generated. The sum is then placed in the output product register on the rising edge of CLK PR. When ACC is low, the product is stored directly into the output register on the rising edge of CLK PR. The ACC signal is loaded into the control register at the rising edge of CLK X or CLK Y.
53	SUB	Subtraction control. When SUB and ACC are high, the content of the output product register is subtracted from the next product generated. The result is then placed in the output product register on the rising edge of CLK PR. When SUB is low and ACC is high, the addition operation is performed instead of subtraction. When ACC is low, SUB is a "Don't Care". The SUB signal is loaded into the control register on the rising edge of CLK X or CLK Y.
54	RND	Round control. When high, causes the product of the X and Y inputs to be rounded to the 19 most significant bits by adding a 1 to the MSB of the LSP. The RND signal is loaded into the control register on the rising edge of CLK X or CLK Y.
55	$\overline{\text{OELS}}$	Active-low output enable for LSP output product register. When high, causes the PR0 through PR15 outputs to be in the high-impedance state.

Pin numbers shown are for the JD and N packages.

PRELOAD FUNCTION TABLE

absolute maximum ratings over operating free-air temperature range†

Supply voltage range, V_{CC}	−0.5 V to 7 V
Input diode current, I_{IK} ($V_I < 0$ or $V_I > V_{CC}$)	±20 mA
Output diode current, I_{OK} ($V_O < 0$ or $V_O > V_{CC}$)	±20 mA
Continuous output current, I_O ($V_O = 0$ to V_{CC})	±25 mA
Continuous current through V_{CC} or GND pins	±50 mA
Lead temperature 1,6 mm (1/16 inch) from case for 60 seconds	300°C
Storage temperature range	−65°C to 150°C

---

† Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

THCT1011M, THCT1011E
16-BIT BY 16-BIT MULTIPLIER/ACCUMULATOR

D2893, XXXX 1985

- 16-Bit by 16-Bit Parallel Multiplication/Accumulation
- 35-Bit-Wide Accumulator
- Inputs are TTL-Voltage Compatible
- Outputs Capable of Driving up to 10 LSTTL Loads
- Single 5-V Power Supply
- Low Power Dissipation . . . 150 mW Typical
- Similar to the THCT1010, TRW TDC1010J, and AM29510
- Pipeline Register Increases Operating Frequency 50% Compared to THCT1010
- High-Speed Twin-Well CMOS Process
- Package Options Include Ceramic Chip Carriers and Ceramic DIPs, Plastic Chip Carriers, and Plastic DIPs
- Dependable Texas Instruments Quality and Reliability

description

The THCT1011 is a TTL-voltage-compatible, low-power, high-speed 16-bit by 16-bit multiplier/accumulator for digital signal processing, digital filters, fast Fourier transformations, array processing, and microprocessor throughput enhancement. These devices are similar in operation to the THCT1010 and the TDC1010J. The pipeline feature enables faster operation and the CMOS technology ensures minimal power dissipation. The lower power dissipation causes the differences between junction and ambient temperatures to be minimized and, therefore, eliminates the heat-sink requirements and increases reliability. High-speed is achieved by using a modified Booth algorithm, a feed-forward carry circuit, and a conditional sum adder that enhances the final adder stage of the multiplier.

The THCT1011 inputs consist of three registers, a 16-bit X input, a 16-bit Y input, and an input control register. The 35-bit output product

Caution. These devices have limited built-in gate protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

register consists of a 16-bit most-significant-product (MSP) bus, a 16-bit least-significant-product (LSP) bus that is shared with the 16-bit Y input bus, and a 3-bit extended-product (XTP) bus (PR32 through PR34); see the functional block diagram. The input registers are independently controlled by CLK X and CLK Y, and the product registers are D-type positive-edge-triggered flip-flops. Separate three-state output enables are provided for each output product register. These, in combination with the independent input clocks, allow operation on a microprocessor bus.

The THCT1011 differs from the THCT1010 by the addition of a pipeline register. The pipeline register is inserted between the multiplier and the accumulator (adder/subtractor) and is latched by the product clock (CLK PR). A multiplication requires two CLK PR cycles to output. Data is first loaded into the X and Y input registers. The first rising edge of the CLK PR latches the product into the pipeline register. New data can be loaded into the X and Y input registers simultaneously. On the second rising edge of CLK PR, the first product is loaded into the output register while the second product is loaded into the pipeline register (see Figure 1). In pipelined operations, a new product is produced every product clock cycle (CLK PR) and the multiply/accumulate rate is limited by the multiply time (t_{mult}).

The THCT1011 has a round control (RND) that rounds the product to the 19 most significant bits. The preload control (PREL) is used in conjunction with the output enables to initialize the contents of the output registers. The THCT1011 will perform multiplication and addition, multiplication and subtraction, or straight multiplication depending upon the states of the accumulate control (ACC) and subtractor control (SUB). The TC control provides the capability of formatting the input data to be either two's complement or unsigned magnitude.

The THCT1011M is characterized for operation over the full military temperature range of −55 °C to 125 °C. The THCT1011E is characterized for operation from −40 °C to 85 °C.

PIN NO.	 NAME	DESCRIPTION
56–64, 1–7	X15 thru X0	X data inputs, X15 is the most significant bit. The data is loaded into the X register on the rising edge of CLKX.
8–15, 17–24	Y0/PR0 thru Y15/PR15	I/O ports for least-significant-product (LSP) bits of output product register, input ports for Y data. Y0/PR0 is the least significant bit. The mode is controlled by the PREL and $\overline{\text{OEMS}}$ pins.
25–43	PR16 thru PR34	I/O ports for output product register bits. PR16 through PR31 are the most-significant-product (MSP) bits. PR32 through PR34 are the extended product (XTP) bits. The mode is controlled by PREL, $\overline{\text{OELS}}$, $\overline{\text{OEX}}$.
44	CLK PR	Product clock input. On the low-to-high transition, latches the product into the pipeline register and the LSP, MSP, and XTP into the output product register.
45	$\overline{\text{OEMS}}$	Active-low output enable for MSP output product register. When high, causes the PR31 through PR16 outputs to be in the high-impedance state.
46	PREL	Preload control. When high, the output product register's outputs are disabled. When an output enable ($\overline{\text{OELS}}$, $\overline{\text{OEMS}}$, $\overline{\text{OEX}}$) is high, preload data can be entered into the output product register from the PR I/O lines on the rising edge of CLK PR.
47	$\overline{\text{OEX}}$	Active-low output enable for XTP output product register. When high, causes the PR32 through PR34 outputs to be in the high-impedance state.
48	TC	Two's complement control. When TC is high, the input data is in two's complement format. When TC is low, the input data is in unsigned magnitude format. The TC signal is loaded into the control register on the rising edge of CLK X or CLK Y.
50	CLK Y	Y clock input. On the low-to-high transition, clocks data in from the Y inputs.
51	CLK X	X clock input. On the low-to-high transition, clocks data in from the X inputs.
52	ACC	Accumulator control. When ACC is high and SUB is low, the content of the output product register is added to the next product generated. The sum is then placed in the output product register on the rising edge of CLK PR. When ACC is low, the product is stored directly into the output register on the rising edge of CLK PR. The ACC signal is loaded into the control register at the rising edge of CLK X or CLK Y.
53	SUB	Subtraction control. When SUB and ACC are high, the content of the output product register is subtracted from the next product generated. The result is then placed in the output product register on the rising edge of CLK PR. When SUB is low and ACC is high, the addition operation is performed instead of subtraction. When ACC is low, SUB is a "Don't Care". The SUB signal is loaded into the control register on the rising edge of CLK X or CLK Y.
54	RND	Round control. When high, causes the product of the X and Y inputs to be rounded to the 19 most significant bits by adding a 1 to the MSB of the LSP. The RND signal is loaded into the control register on the rising edge of CLK X or CLK Y.
55	$\overline{\text{OELS}}$	Active-low output enable for LSP output product register. When high, causes the PR0 through PR15 outputs to be in the high-impedance state.

Pin numbers shown are for the JD and N packages.

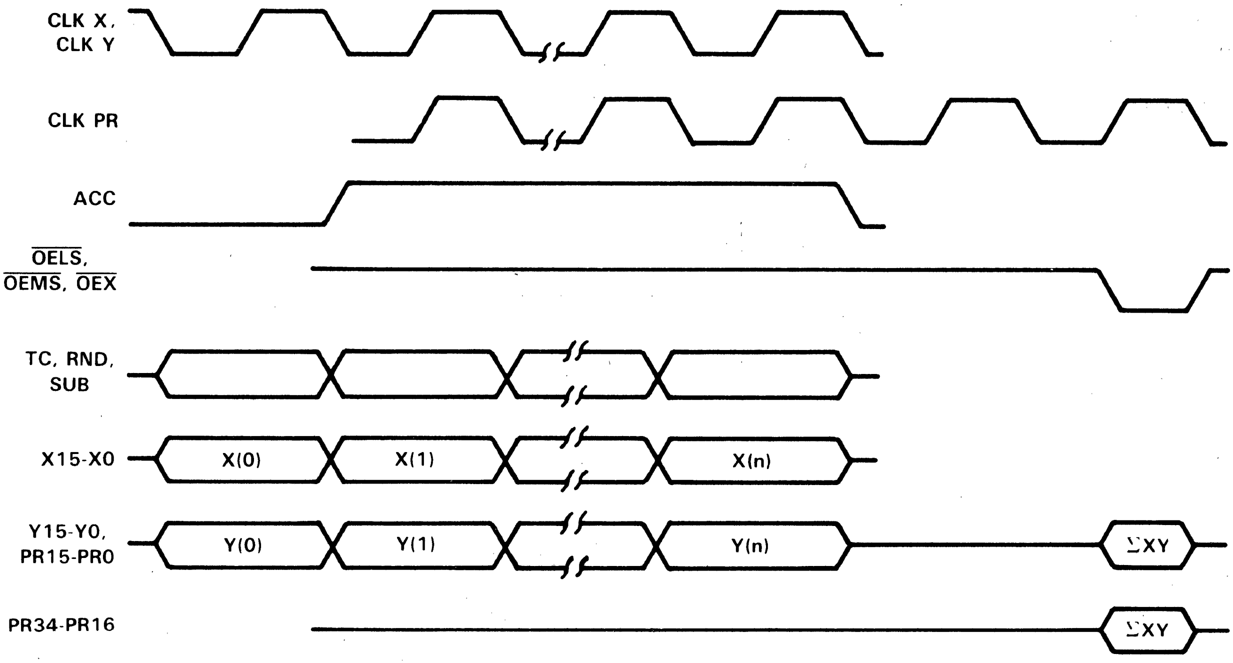

FIGURE 1. TYPICAL PIPELINED MULTIPLY/ACCUMULATE CYCLE

absolute maximum ratings over operating free-air temperature range†

Supply voltage range, V_{CC}	−0.5 V to 7 V
Input diode current, I_{IK} ($V_I < 0$ or $V_I > V_{CC}$)	±20 mA
Output diode current, I_{OK} ($V_O < 0$ or $V_O > V_{CC}$)	±20 mA
Continuous output current, I_O ($V_O = 0$ to V_{CC})	±25 mA
Continuous current through V_{CC} or GND pins	±50 mA
Lead temperature 1,6 mm (1/16 inch) from case for 60 seconds	300°C
Storage temperature range	−65°C to 150°C

---

† Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

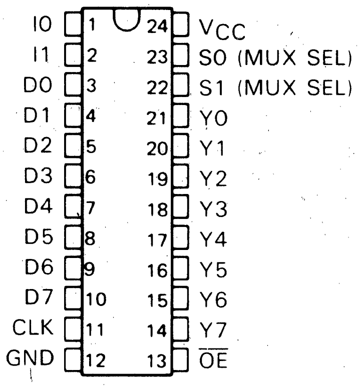
(TOP VIEW)



description

The THCT29520 and THCT29521 are high-speed CMOS multilevel pipeline registers. They are interchangeable with the Advanced Micro Device bipolar AM29520 and AM29521 but dissipate a fraction of the power.

The THCT29520 and THCT29521 contain four 8-bit positive-edge-triggered registers. The registers can operate as one set of 4-level pipeline registers or two sets of 2-level pipeline registers. The output can be selected from any one of the four registers.

The THCT29520 and THCT29521 differ in the way data is transferred in the dual 2-level register modes (I = 01 or 10). For the THCT29520, new data is written into the first-level register while the old data in the first-level register is shifted into the second-level register. For the THCT29521, new data is written over the old data in the first-level register. The data in the second-level register remains unchanged.

The THCT29520 and THCT29521 are characterized for operation from 0°C to 70°C. The THCT29520E and THCT29521E are characterized for operation from −40°C to 85°C.

*The label "OC4/2C4" means that the clock in register A2 affects the eight data inputs of that register, collectively labeled "4D", only in modes 0 and 2 (I1, I0 = L L and H L, respectively). This logic diagram applies specifically for the THCT29520. For the THCT29521, the labels marked with the asterisks in registers A2 and B2 would both be reduced to "OC4" (as in the logic symbols on the previous page) indicating that these clocks have effect only in mode 0 in that device. Otherwise this diagram applies to both devices.

absolute maximum rating over operating free-air temperature range (see Note 1)

Supply voltage, V_{CC}	−0.5 V to 7 V
Input diode current, I_{IK} ($V_I < 0$ or $V_I > V_{CC}$	±20 mA
Output diode current, I_{OK} ($V_O < 0$ or $V_O > V_{CC}$	±20 mA
Continuous output current, I_O ($V_O = 0$ to V_{CC})	±35 mA
Continuous current through V_{CC} or GND	±70 mA
Lead temperature 1,6 mm (1/16 inch) from case for 60 seconds	300 °C
Storage temperature range	−65 °C to 150 °C

NOTE 1: Stress beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated in the "recommended operating conditions" section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

description

The THCT2000 direction discriminator can determine the direction and displacement of a mechanical device based on input signals from two transducers in quadrature. It can also measure a pulse duration using a known clock rate, or a frequency over a known time interval. It includes a 16-bit counter, which can be used separately. Several of these devices may be cascaded to provide accuracy greater than 16-bits.

The device may be used in many diverse applications, and is specifically designed for use in many types of microprocessor-based systems. Some of the possibilities include motor controls, robotics, tracker balls (mice), lathe or tooling machines, automobiles, and conveyer belts or other transport mechanisms.

The THCT2000M is characterized for operation over the full military temperature range of −55 °C to 125 °C. The THCT2000E is characterized for operation from −40 °C to 85 °C.

PRODUCT PREVIEW documents contain information on products in the formative or design phase of development. Characteristic data and other specifications are design goals. Texas Instruments reserves the right to change or discontinue these products without notice.

architecture

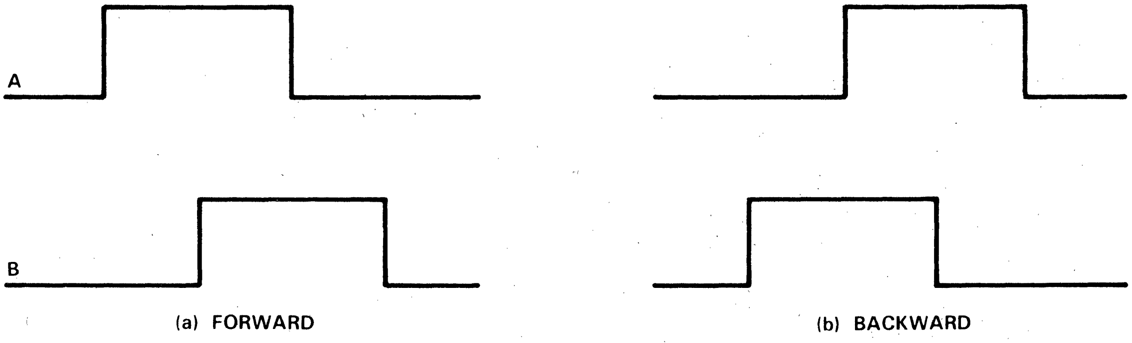
There are four major functional blocks in the THCT2000. The measurement and mode-control logic generates internal up- or down-count pulses (I1 and I2) from the quadrature signals A and B, the clock input, and the mode controls M0, M1, and M2. The control logic provides common microprocessor interface signals. The output register latches the value of the counter. The output multiplexer allows the processor to read either the upper or lower byte in the register.

16-bit up/down counter, mode 0

In mode 0 the THCT2000 can be used as a 16-bit up/down counter. To use the THCT2000 as a 16-bit counter, the BI signal is high and a high-to-low transition at CI increments the counter. To count down, the CI signal is high and a high-to-low transition at BI decrements the counter. In this mode CLK does not have any effect on the contents of the counter. The counter can be preloaded using $\overline{\text{CS}}$, $\overline{\text{WE}}$, and LSB/$\overline{\text{MSB}}$.

direction discriminator, modes 1 through 5

In Figure 1, the quadrature signals A and B identify forward or backward directions. If A leads B, the forward direction is indicated and the counter will count up. If A lags B, the backward direction is indicated and the counter will count down.



(a) FORWARD (b) BACKWARD

FIGURE 1. QUADRATURE SIGNALS

Signals A and B are each stored in the first of a pair of consecutive D-type flip-flops on a high-to-low transition of the clock and transferred to the next on a low-to-high transition of the clock. The THCT2000 measurement logic compares the states of the four D-type flip-flops and generates the correct up or down pulses for the user selected mode. (See Figures 2 and 3).

Modes 1 through 5 define which edge of the quadrature signals will be counted, in accordance with Table 1. The clock frequency should be at least four times greater than the frequencies of the quadrature signals. This will eliminate problems resulting from timing jitter in the transducer and will allow the quadruple counting mode to be used. The frequency of the quadrature signals A and B may be calculated from the relationship:

$$f = \frac{\text{shaft speed}}{\text{resolution of transducer}}$$

functional block diagram

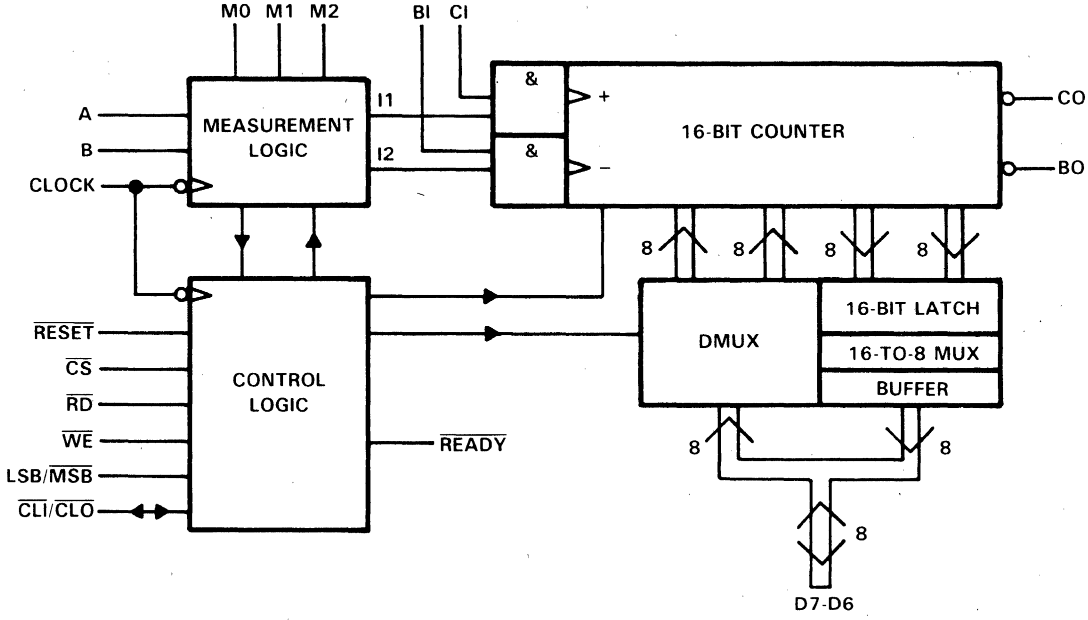


TABLE 1. MODE SELECTION

MODE	M2	M1	M0	MODE DESCRIPTION
				16-Bit Up/Down Counter
0	L	L	L	Falling transition on CI with BI high counts up. Falling transition on BI with CI high counts down.
				Direction Discriminator
1	L	L	H	A single-count pulse is generated on the first falling edge of CLK following A going high while B is low (corresponding to the forward direction) or A going low while B is low (corresponding to the backward direction) (see Figures 2 and 3).
2	L	H	L	A single-count pulse is generated on the first falling of CLK following B going high while A is high (corresponding to the forward direction) or B going low while A is high (corresponding to the backward direction) (see Figures 2 and 3).
3	L	H	H	A single-count pulse is generated on the first falling edge of CLK following A going high or going low (see Figures 2 and 3).
4	H	L	L	A single-count pulse is generated on the first falling edge of CLK following B going high or going low (see Figures 2 and 3).
5	H	L	H	A single-count pulse is generated on the first falling edge of CLK following either A or B going high or going low (see Figures 2 and 3).
				Pulse Duration Measurement
6	H	H	L	A is the count enable signal. B is high for upcounting and low for downcounting. Count is synchronous with rising edge of clock.
				Frequency Measurement
7	H	H	H	A is the signal frequency to be measured. B is the gate signal of known time interval. Count is synchronous with rising edge of A.

FIGURE 3. DIRECTION DISCRIMINATOR—BACKWARD DIRECTION

pulse-duration measurement, mode 6

In this mode, A acts as the count enable input, and the duration of a high-level pulse applied to A can be measured. A transition from low to high on A will enable counting at the input clock frequency. A high-to-low transition will disable counting, load the value of the counter into the output register, pull $\overline{\mathrm{CLI}}/\overline{\mathrm{CLO}}$ low, and then clear the counter (see Figure 4). If B is held high the counter will count up, and if B is held low, the counter will count down.

The counter can be preloaded by activating $\overline{\mathrm{CS}}$, $\overline{\mathrm{WE}}$, and LSB/$\overline{\mathrm{MSB}}$; this must be done while A is low. The output register should be read by activating $\overline{\mathrm{CS}}$, $\overline{\mathrm{RD}}$, and LSB/$\overline{\mathrm{MSB}}$ after A has had a high-to-low transition. In other words, once the output register has been loaded with the contents of the counter (caused by a high-to-low transition on A), the contents of the output register can be read at any time before A has another high-to-low transition. The output register can only be loaded by the falling edge of A.

In the pulse-duration mode, the minimum time that can be measured is

$$t_{min} = \frac{2}{f_{clock}}$$

The pulse duration of A is

$$t_{wA} = \frac{N}{f_{clock}}$$

and the error is $\pm \dfrac{1}{f_{clock}}$

Where:

N = number of counts

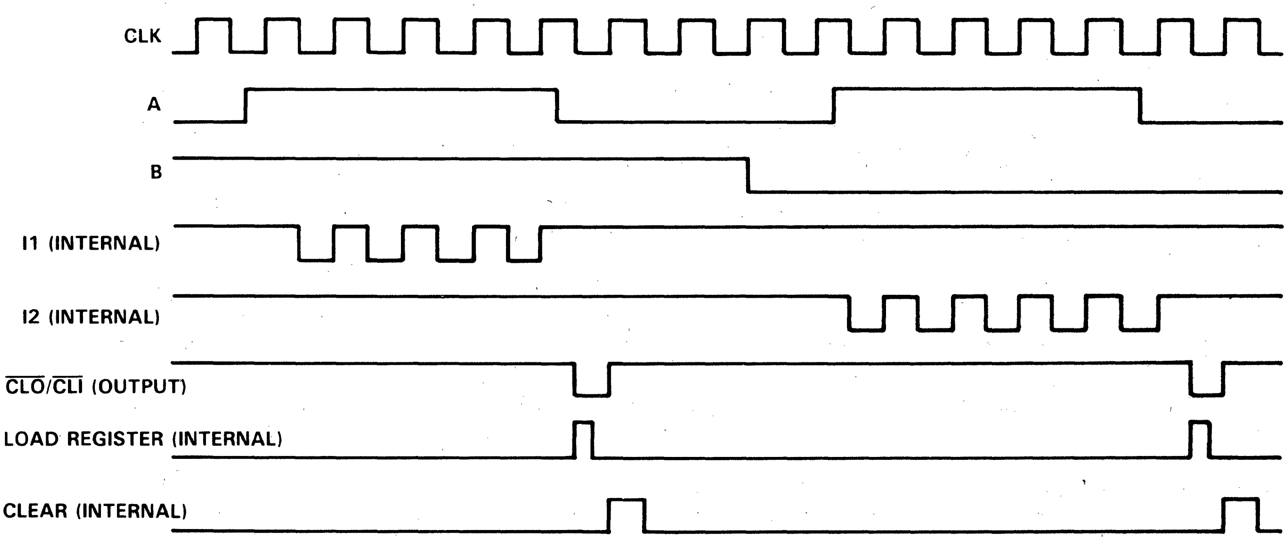

FIGURE 4. PULSE-DURATION MEASUREMENT (MODE 6)

frequency measurement, mode 7

In this mode, A is the signal of unknown frequency to be measured, and B is a gate signal of known duration. A low-to-high transition of B enables the counting at the frequency of A. A high-to-low transition of B disables the counting and the value of the counter is loaded into the output register, $\overline{\text{CLI}}/\overline{\text{CLO}}$ is pulled low, and the counter is cleared (see Figure 5).

The counter can be preloaded by activating $\overline{\text{CS}}$, $\overline{\text{WE}}$, and LSB/$\overline{\text{MSB}}$; this must be done while B is low. The output register should be read by activating $\overline{\text{CS}}$, $\overline{\text{RD}}$, and LSB/$\overline{\text{MSB}}$ after B has had a high-to-low transition. In other words, once the output register has been loaded with the contents of the counter (caused by a high-to-low transition on B), the contents of the output register can be read at any time before B has another high-to-low transition. The output register can only be loaded by the falling edge of B.

The maximum frequency that can be measured is

$$f = \frac{f_{clock}}{2}$$

The minimum time A must remain high is

$$t_{wA} = \frac{2}{f_{clock}}$$

and the frequency of A is

$$f_A = \frac{N}{t_{wB}}$$

Where:

N = number of counts
t_{wB} = pulse duration of B

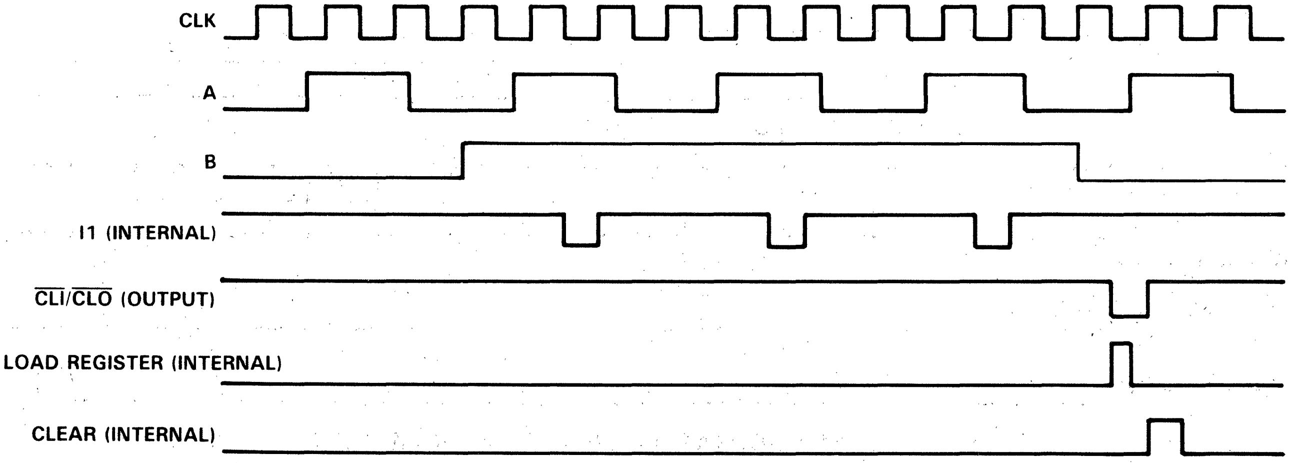

FIGURE 5. FREQUENCY MEASUREMENT (MODE 7)

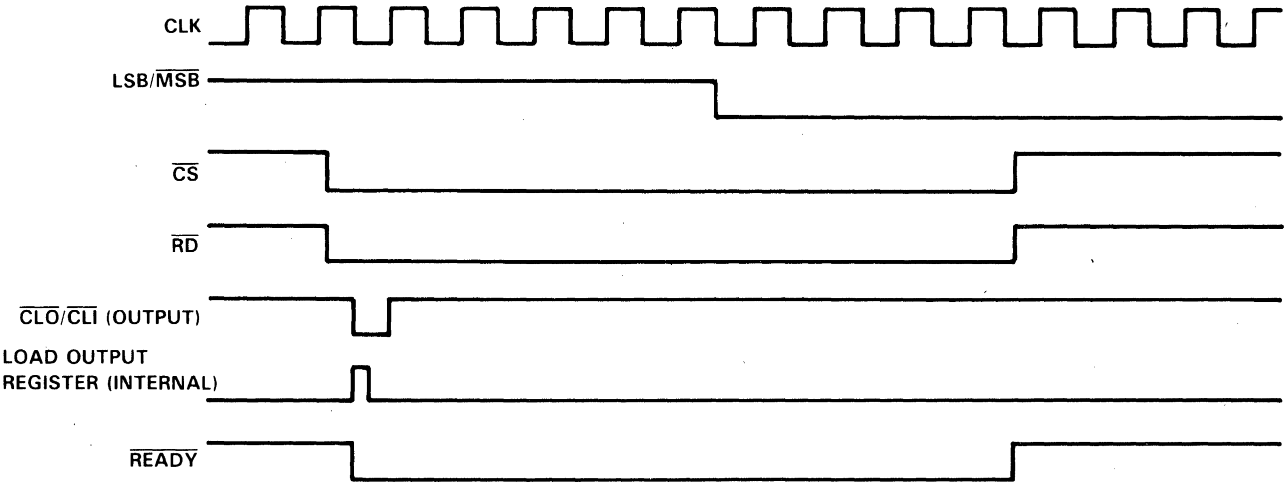
read operation

The contents of the counter can be read at any time while in modes 0 through 5 by pulling $\overline{CS}$ and $\overline{RD}$ low. The most significant byte may be selected by setting LSB/$\overline{MSB}$ low, and the least significant byte may be read by setting LSB/$\overline{MSB}$ high. This will cause a load-output-register pulse to be generated and $\overline{CLI}/\overline{CLO}$ will go low during the next low clock phase. $\overline{READY}$ will also go low as the clock goes low, and will stay low until $\overline{CS}$ and/or $\overline{RD}$ go high. The load-output-register pulse stores the current value of the counter in a 16-bit latch register and LSB/$\overline{MSB}$ directs the proper byte through a multiplexer to the outputs. $\overline{CS}$ and $\overline{RD}$ also enable the 3-state outputs (See Figure 6).



CLK
LSB/$\overline{MSB}$
$\overline{CS}$
$\overline{RD}$
$\overline{CLO}/\overline{CLI}$ (OUTPUT)
LOAD OUTPUT REGISTER (INTERNAL)
$\overline{READY}$

FIGURE 6

There are two sets of conditions that will cause the load-output-register pulse to be inhibited:

1. After a reset has occurred, the first time $\overline{CS}$ goes low the value of LSB/$\overline{MSB}$ will set a latch within the device. From that time until the next reset, LSB/$\overline{MSB}$ must be that same value in order to trigger the load-output-register pulse during a read operation. If the value of LSB/$\overline{MSB}$ is the opposite to the value stored in the latch, the load pulse will be inhibited, and the pulse will not be generated until a new read cycle is initiated with LSB/$\overline{MSB}$ properly applied. Holding LSB/$\overline{MSB}$ at the inhibiting level will also keep $\overline{CLI}/\overline{CLO}$ from loading the output register. Thus, the high and low bytes should always be read in the same order. This is to control unwanted load-output-register pulses.
2. Every time $\overline{CS}$ and $\overline{RD}$ go low after $\overline{CLI}/\overline{CLO}$ has been externally pulled low, and until a reset occurs, the load-output-register pulse will be inhibited to allow the data loaded to be read.

In modes 0 through 5 the output register will be loaded immediately if $\overline{CLI}/\overline{CLO}$ is pulled low. Every time $\overline{CS}$ and $\overline{RD}$ go low following $\overline{CLI}/\overline{CLO}$ going low, and until a reset occurs, the load-output-register operation will be inhibited. Thus, the value stored in the register by $\overline{CLI}/\overline{CLO}$ can be read. This is important in allowing the device to be cascaded (See Figure 7). It is important that $\overline{CLI}/\overline{CLO}$ never goes falsely low.

LOAD REGISTER
$\overline{\text{READY}}$

FIGURE 7

write operation

A number may be preloaded into the counter by pulling $\overline{\text{CS}}$ and $\overline{\text{WE}}$ low while using LSB/$\overline{\text{MSB}}$ to direct the value on the data bus to the selected byte of the counter. This will cause $\overline{\text{READY}}$ to go low on the next falling clock edge, and to remain low until $\overline{\text{CS}}$ and $\overline{\text{WE}}$ go high.

reset operation

A reset is initiated by pulling the $\overline{\text{RESET}}$ pin low. This clears the counter to zero, resets the D-type flip-flops at the inputs of the quadrature signals A and B, and clears the latches that inhibit the load register pulse (see Figure 8). To avoid a spurious count after a reset, the A and B inputs should be held to the values indicated in Table 2 during and just after the reset pulse. The reset pin does not clear the output register.

V54/74 A•C•T INTERFACE LOGIC FAMILY

VTC Incorporated

VTC'S V54/74 "A•C•T" Family gives you **A**LS speed, **C** MOS power, and **T**TL drive.
It's the coolest new family of interface functions: state-of-the-art interfaces for the latest microprocessors, memories, and gate arrays. True third-generation logic functions featuring an advanced 1.6 micron, double level metal CMOS process.
Fifty TTL-compatible functions include 8, 9 and 10-bit buffers, latches, flip-flops, and transceivers.
VTC's A•C•T Family: the new standard in interface functions.

V54/74 A•C•T INTERFACE LOGIC FAMILY

VTC Incorporated

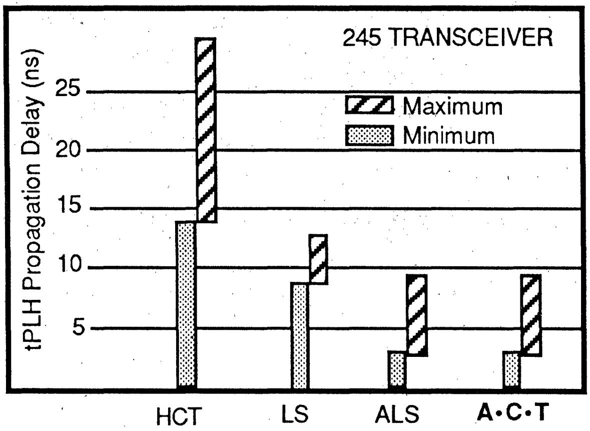
ALS SPEED

5ns Typical Propagation Delay

VTC's A•C•T is a direct replacement for ALS and 29800, and the ultimate upgrade for HCT interface functions, with:

- Propagation delays that meet or exceed those of ALS
- Operating frequencies to 75MHz
- And power consumption always less than bipolar

The VTC A•C•T Family obsoletes HCT and ALS interface functions altogether.



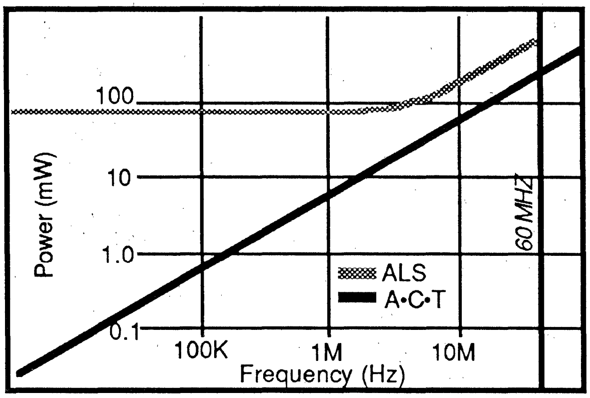
CMOS POWER

50 µW Typical Quiescent Power

A cool A•C•T featuring:

- Quiescent power reduction of 3 to 5 orders of magnitude over ALS
- Power consumption always less than bipolar-even at 75MHz
- And, power dissipation only 10mW per MHz

With VTC's A•C•T Family, you no longer have to sacrifice speed and drive to get low power.



TTL DRIVE

48mA Constant Current Drive

That 48mA is guaranteed across the entire VTC A•C•T Family.

- All A•C•T products are fully characterized, with guaranteed mins and maxs over:
  - temperature
  - power supply range
  - 50pF and 300pF loads
- Rugged enough to drive 50 ohm lines

And, VTC's proprietary output circuitry provides significantly improved switching characteristics.

V54ACT240
V74ACT240
OCTAL BUFFERS AND LINE DRIVERS WITH 3-STATE OUTPUTS

VTC Incorporated

FEATURES:
- CMOS Replacement for ALS
- High speed, 5ns Typical
- TTL Levels, I_{OL}/I_{OH} = 48 mA Commercial, 32 mA Military
- Low Input Current, 1μA Max
- Fully Specified: 5V ± 10% Power Supply
  50pF and 300pF Loading
  Min and Max over Temperature

FUNCTIONAL DESCRIPTION:
These are dual 4-bit inverting buffer drivers. $\overline{\text{G1}}$ and $\overline{\text{G2}}$ are the two separate enable lines. When $\overline{\text{G}}$ is low, the buffers are enabled and bus Y gets $\overline{\text{A}}$ values. A high value of $\overline{\text{G}}$ disables the buffers.

This octal high performance interface family is designed for high capacitance, low impedance load drive. It is compatable with TTL I/O and ALS performance. These features are ideal for bus oriented interface buffering, memory drives, and clock or line drives.

OCTAL BUS TRANSCEIVERS WITH 3-STATE OUTPUTS

VTC Incorporated

FEATURES:
- CMOS Replacement for ALS
- High speed, 5ns Typical
- TTL Levels, I_{OL}/I_{OH} = 48 mA Commercial,
  32 mA Military
- Low Input Current, 1µA Max
- Fully Specified: 5V ± 10% Power Supply
  50pF and 300pF Loading
  Min and Max over Temperature

FUNCTIONAL DESCRIPTION:

These 8-bit transceivers allow synchronous two way communication between data buses A and B. The DIR signal controls the direction of data flow. When DIR is high, data flows from A to B. When DIR is low, data flows from B to A. The $\overline{G}$ signal enables the buffer.

These parts are designed to interface with 3-state buses and I/O ports. The TTL logic levels are ideal for interfacing with high-capacitance, low impedance loads on both buses A and B.

FUNCTION TABLE

OCTAL D-TYPE TRANSPARENT LATCHES WITH 3-STATE OUTPUTS

VTC Incorporated

FEATURES:

- CMOS Replacement for ALS
- High speed, 6ns Typical
- TTL Levels, I_{OL}/I_{OH} = 48 mA Commercial,
  32 mA Military
- Low Input Current, 1µA Max
- Fully Specified: 5V ± 10% Power Supply
  50pF and 300pF Loading
  Min and Max over Temperature

FUNCTIONAL DESCRIPTION:

These are 8-bit transparent D-type latches. While latch enable C is high, the latch output will follow the data input. The data at input D is latched when the enable is taken low.

The $\overline{OC}$ output-control signal can be used to place all the outputs in active, or high impedence state. The latch data can be changed independant of $\overline{OC}$.

These parts have been designed to interface with 3-state buses and I/O ports or used as storage elements. The TTL logic levels are ideal for interfacing with high-capacitance, low impedance loads. (50 ohms typical)

10-BIT BUS INTERFACE FLIP-FLOPS WITH 3-STATE OUTPUTS

VTC Incorporated

FEATURES:

- CMOS Replacement for ALS
- High speed, 6ns Typical
- TTL Levels, I_{OL}/I_{OH} = 48 mA Commercial, 32 mA Military
- Low Input Current, 1µA Max
- Fully Specified: 5V ± 10% Power Supply
  50pF and 300pF Loading
  Min and Max over Temperature

FUNCTIONAL DESCRIPTION:

These are 10-bit edge triggered flip-flops. The data is latched by the low to high edge transition of the CLK signal.

The $\overline{OC}$ output control signal can be used to place all the outputs in active, or high impedence state. Data in flip-flops can be changed independant of $\overline{OC}$.

These parts have been designed to interface with 3-state buses and I/O ports or used as working registers. The high drive capability, 48mA I_{OL}/I_{OH}, at the TTL logic levels is ideal for interfacing with high-capacitance, low impedance loads.

V54ACT864
V74ACT864
9-BIT BUS TRANSCEIVERS WITH 3-STATE OUTPUTS

VTC Incorporated

FEATURES:
- * CMOS Replacement for ALS
- * High speed, 5ns Typical
- * TTL Levels, I_{OL}/I_{OH} = 48 mA Commercial, 32 mA Military
- *Low Input Current, 1µA Max
- *Fully Specified: 5V ± 10% Power Supply
50pF and 300pF Loading
Min and Max over Temperature

FUNCTIONAL DESCRIPTION:

These are inverting 9-bit transceivers with dual-control enables $\overline{\text{OEA1}}$, $\overline{\text{OEA2}}$ and $\overline{\text{OEB1}}$, $\overline{\text{OEB2}}$. When both enables are low, the transceivers conduct from one port to the other. The nine bits provide the capability to transmit parity on the system buses among other possible uses.

These parts are designed to interface with 3-state buses and I/O ports. The high drive capability, 48 mA I_{OH}/I_{OL}, at the TTL logic levels is ideal for interfacing with high-capacitance, low impedance loads on both buses A and B.

A·C·T NOW!

VTC's A·C·T Family: The New Triple Play in Interface Logic

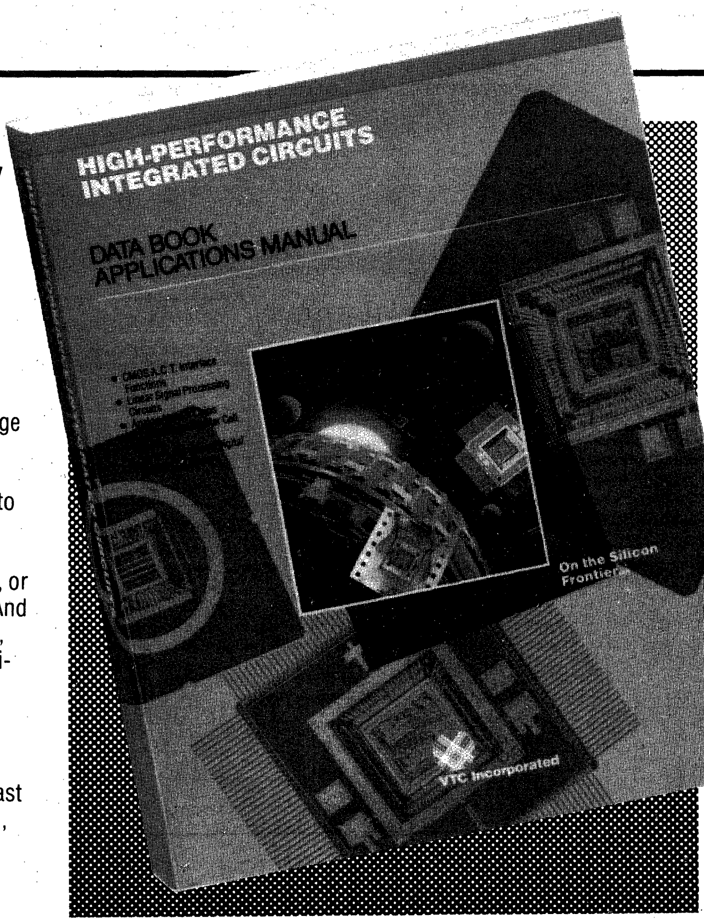
ALS speed, **C**MOS power, and **T**TL drive. Plus:

- ESD protection guaranteed at more than 2000V
- Latch-up immunity greater than 200mA—guaranteed
- Wide commercial temp range of −40°C to +85°C
- Improved noise margins
- And operating frequencies to 75MHz

What are you waiting for? Just pick up the phone, write, or use the reader service card. And we'll send you our brand new, 300-page "Data Book & Applications Manual."

The *V54/74 A·C·T Interface Logic Family:* the time to ACT is now.

VTC Incorporated, 2401 East 86th Street, P.O. Box 201559, Bloomington, MN 55420. 612/854-8830.



HIGH-PERFORMANCE INTEGRATED CIRCUITS
DATA BOOK APPLICATIONS MANUAL
On the Silicon Frontier
VTC Incorporated

VTC Data Book and Applications Manual

More than 300 pages, including 50 complete A·C·T Family data sheets with:

- AC&DC characterization tables
- derating curves
- mins and maxs specified over temperature, voltage, and load

Plus 70 pages of application notes, including:

- System design considerations
- Backplane bus design examples
- ESD and latch-up discussion
- Complete test definitions

INTRODUCTION TO MICROPROCESSORS

This section begins with a "Master Selection Guide" that covers all major parameters needed to choose a microprocessor for particular application. Microprocessors are sequenced by increasing data word size and then alphabetically by manufacturer.

Next, once you've chosen the proper microprocessor for your application, go to the "System Components" section. Arranged alphanumerically by microprocessor, it shows all the available peripheral devices that work with a particular microprocessor.

Finally, there is a "General Purpose" section describing devices that can be used in different microprocessor systems, not necessarily with one family.

Detailed Product Information provided by:

AT&T	1602
Chips & Technology	1604
Fairchild	1607
Fujitsu Microelectronics	1611
Goldstar	1612
Gould AMI	1613
GTE Microcircuits	1615
Harris	1618
Hitachi	1632
Inmos	1636
Integrated Device Technology	1638
Intersil	1645
Mostek	1647
Motorola Semiconductor	1654
NCR Microelectronics	1671
RCA Solid State	1673
Signetics	1681
Toshiba America	1750
VLSI Technology	1751
Zilog	1773

The manufacturers listed above have provided detailed information on their latest and most significant products.

EINFÜHRUNG MIKRO-PROZESSOREN

Dieser Abschnitt beginnt mit einem "Master Selection Guide", der alle Parameter enthält, die zur Auswahl eines für einen bestimmten Anwendungsfall geeigneten Mikroprozessors erforderlich sind.

Haben Sie einmal den für Ihren Anwendungsfall geeigneten Mikroprozessor gefunden, so gehen Sie weiter zum Abscnitt "Systemkomponenten" (System Components). In alphanumerischer Reihenfolge der Mikroprozessoren, enthält dieser Teil alle peripheren Bausteine, die für einen bestimmten Mokroprozessor verfügbar sind.

Schließlich gibt es noch den Abschnitt "Allgemeine Verwendung" (General Purpose) mit einer Beschreibung von Bauelementen, die für verschiedene Mikroprozessoren geeignet und nicht ausschließlich an ein System gebunded sind.

Alle Hersteller sind in alphanumerischer Reihenfolge aufgeführt.

INTRODUCTION AUX MICRO-PROCESSEURS

Cette Section débute par un Guide Général de Sélection qui couvre tous les paramètres importants utilisés dans le choix d'un microprocesseur pour une application bien déterminée.

Après avoir choisi le microprocesseur nécessaire à votre application, reportez-vous à la Section "Composants du Système (System Components). Une liste alphanumérique des microprocesseurs indique quels types d'appareils sont à utiliser avec tel ou tel microprocesseur.

Enfin, une Section intitulée "Applications Générales" ((General Purpose) décrit les appareils qui peuvant être utilisée dans différents systèmes de microprocesseur, et n'appartenent pas uniquement à une sule famille.

Toutes les sociétés fabricantes sont étudiées par ordre alphanumérique.

INTRODUCCIÓN AL MICROPROCESOR

Esta sección empieza con una Guía Maestra de Selección que cubre los parámetros necesitados en la selección del microprocesor para una aplicación determinada.

Después, una vez escogido el microprocesor para su aplicación, refiérase a la sección "Componentes de Sistema." Arreglado en orden alfabético y numérico por microprocesor, muestra todas las componentes periferales que funcionan con un microprocesor determinado.

Finalmente, hay una sección de "Propósito General" describiendo las componentes que pueden ser usadas en distintos sistemas de microprocesores, no necesariamente dentro de una familia.

Todos los fabricantes aparencen en orden alfabético y numérico.

マイクロプロセサーへの案内

このセクションは"マスターセレクションガイド"で始り利用者皆様のお知りになり度いマイクロプロセサーを選択するのに必要な全ての主要パラメーターを記載しています。そのマイクロプロセサーを見つけたら次に"システムコンポーネント"セクションに進んで下さい。マイクロプロセサーがアルファベット順，数学の若い順に並んでおり，そのマイクロプロセサーの周辺製品が記載されています。

最后は"ジェネラルパーパスセクション"であり，一つのマイクロプロセサーファミリー丈でなく他のマイクロプロセサーシステムにも使用される製品を紹介しています。全てのメーカーはアルファベット順，若い数字順にのっています。

x		x	x	x		Same as COP2440 except no on chip ROM and faster execution time (4μs). Interfaces with MM2716 EPROM. COP2304 is extended temperature range device.	COP2404	National	
x					Eurotechnique	Dual CPU microcontroller, programmable counter, zero crossing detector serial I/O port. 35 I/O lines, COP23XX extended temperature range.	COP2440	National	
x		x	x	x		Piggyback Microcontroller. Same as COP2440 except socket for development EPROM.	COP2440R	National	15
x					Eurotechnique	Same as COP2440 except 23 I/O lines.	COP2441	National	
x					Eurotechnique	Same as COP2440 except 19 I/O lines.	COP2442	National	
x		x	x	x		Romless microcontroller, emulated COP410L/COP411L, interfaces with external memory, will accept MM2716, NM27C16, MM2758A, MM2758B 1K byte accessories.	COP401L	National	
x		x	x	x		Same as COP401L except emulates COP413L with selected RC oscillator option.	COP401L-R13	National	
x		x	x	x		Same as COP401L except emulates COP413L with selected RC oscillator option.	COP401L-X13	National	20
x		x	x	x	Western Digital	Has piggyback EPROM socket. Will accept: MM2716, NM27C16, MM2758A, MM2758B. 1K byte accessable.	COP402	National	
x		x	x	x	Western Digital	Has piggyback EPROM socket. Will accept: MM2716, NM27C16, MM2758A, MM2758B. 1K byte accessable.	COP402M	National	
x		x	x	x	Western Digital	Has piggyback EPROM socket. Will accept MM2716, 2758A, 2758B or NM27C16 EPROM. 2K Byte accessable. Open drain memory interface drivers.	COP404LP	National	
x		x	x	x	Western Digital	Same as COP404LP except push pull memory interface drivers.	COP404LS	National	
x		x	x	x		4μs instruction cycle time, 20 I/O lines, 2 level subroutine stack, COP310C operates extended temperature range, COP210C operates full temperature range.	COP410C	National	25
x		x	x	x	Eurotechnique, Western Digital	16 I/O lines, 24 pins, COP310L has extended temperature range (−40°C to -85°C).	COP410L	National	
x		x	x	x		4μs instruction cycle time, 16 I/O lines, 2 level subroutine stack, COP311C operates extended temperature range, COP211C operates full temperature range.	COP411C	National	
x		x	x	x	Eurotechnique, Western Digital	13 I/O lines, 20 pins, COP311L has extended temperature range (−40°C to -85°C).	COP411L	National	
x		x	x	x		16 I/O lines, 20 pins COP313C has extended temperature range (-40°C to 85°C)	COP413C	National	
x		x	x	x		16 I/O lines, 20 pins COP313CH has extended temperature range.	COP413CH	National	30
x		x	x	x		15 I/O lines, 20 pins, COP313L has extended temperature range.	COP413L	National	
x		x	x	x	Eurotechnique, Western Digital	COP32X is extended temperature range version. Also available in smaller packages: COP421 series-24 pins, COP422 series-20 pins.	COP420	National

x		x	x	x	Eurotechnique, Western Digital	Same as COP420 except 23 I/O lines.	COP420L	National	
x		x	x	x		Basically the same as COP420 except piggyback microcontroller. CPU, RAM, I/O and EPROM socket. Accepts: MM2716, NMC27C16, MM2758A, MM2758B. 1K byte accessable.	COP420R	National	
x		x	x	x		23 I/O lines. COP324C has extended temperature range (−40°C to 85°C).	COP424C	National	
x		x	x	x		COP424C less 4 general-purpose inputs.	COP425C	National	
x		x	x	x		COP424C less eight general purpose inputs.	COP426C	National	5
x		x	x	x	Eurotechnique	CPU version of COP2440 series, COP340 is extended temperature range version. 40 pins. 35 I/O lines.	COP440	National	
x		x	x	x		Piggyback Microcontroller: CPU, RAM, I/O and EPROM socket. Accepts: MM2716, NMC27C16, MM2758A, MM27588 EPROMs. Same electrical specs as base P/N.	COP440R	National	
x		x	x	x	Eurotechnique	CPU version of COP2440 series, COP341 is extended temperature range version. 28 pins. 23 I/O lines.	COP441	National	
x		x	x	x	Eurotechnique	CPU version of COP2440 series, COP342 is extended temperature range version. 24 pins. 19 I/O lines.	COP442	National	
x		x	x	x		23 I/O Lines. COP344C has extended temperature range (−40°C to 85°C).	COP444C	National	10
x		x	x	x	Eurotechnique, Western Digital	28 pins, 16 I/O lines.	COP444L	National	
x		x	x	x		Piggyback Microcontroller: CPU, RAM, I/O and EPROM socket. Accepts: MM2716, NMC27C16, MM2758A, MM27588 EPROMs. Same electrical specs as base P/N.	COP444LR	National	
x		x	x	x		COP444C less 4 general-purpose inputs.	COP445C	National	
x		x	x	x	Eurotechnique, Western Digital	24 pin package, no interrupt, 12 I/O lines.	COP445L	National	
						CPU, 23 I/O lines, COP384 has extended temperature range.	COP484	National	15
x						μCOM-4 single chip microprocessor family. Consists of 14 individual devices with various RAM, ROM, I/O subroutine stack level options.	μCOM-4	NEC	
x	x	x	x	x		ROM-less evaluation chip, 8-bit timer/counter, 8-bit serial interface, 32 I/O lines	μPD7500	NEC	
x	x	x	x	x			μPD7501	NEC	
x	x	x	x	x			μPD7502	NEC	
x	x	x	x	x			μPD7503	NEC	20
x	x	x	x	x		Eight-bit timer/counter, 8-bit serial interface, 32 I/O lines	μPD7506	NEC	
x	x	x	x	x		Eight-bit timer/counter, 8-bit serial interface, 22 I/O lines	μPD7507	NEC	
x	x	x	x	x		Eight-bit timer/counter, 8-bit serial interface, 20 I/O lines	μPD7507S	NEC	
x	x	x	x	x		Eight-bit timer/counter, 8-bit serial interface, 40 I/O lines	μPD7508	NEC	
x	x	x	x	x		Vacuum fluorescent display driver, 8-bit timer/counter, 8-bit serial interface, 32 I/O lines	μPD7508A	NEC	25
x	x	x	x	x		Vacuum fluorescent display driver, 14-bit D/A, 28 I/O lines	μPD7519	NEC	
x	x	x	x	x		Directly drives 8 digit, 8 segment LED display, 24 I/O lines.	μPD7520	NEC	
x		x	x	x		Evaluator chip for Series 40 microcomputers.	**MSM5840**	**OKI (4732)**	
x		x	x	x		30 I/O lines, 8-Bit programmable timer.	**MSM5840RS**	**OKI (4732)**	
x		x	x	x		13 I/O lines, 40 LCD segment outputs, 12-bit timer.	**MSM58421GS**	**OKI (4732)**	30
x		x	x	x		9 I/O lines, 24 Vacuum Fluorescent segment outputs, 8-bit timer.	MSM584223RS	OKI	
x		x	x	x		30 I/O lines, 8-bit timer/counter.	MSM5845	OKI	
x		x	x	x		All the MN14XX series members are available in at least one other process type.	MN1400	Panasonic	
x		x	x	x		All the MN14XX series members are available in at least one other process type.	MN1402	Panasonic	
x		x	x	x		All the MN14XX series members are available in at least one other process type.	MN1403	Panasonic	35
x		x	x	x		All the MN14XX series members are available in at least one other process type.	MN1404	Panasonic

x		x	x	x		Piggy-back microcomputer, emulates 8048/49/50, socket for program module and EPROM.	NS87P50	National	
x	x	x	x	x	SMC	Fully compatible with Z80 instruction set, power-save mode, system clock generator, NSC888 evaluation board available.	NSC800	National	
x	x	x	x	x	SMC	Fully compatible with Z80 instruction set, power-save mode, system clock generator, NSC888 evaluation board available.	NSC800-1	National	
x	x	x	x	x	SMC	Fully compatible with Z80 instruction set, power-save mode, system clock generator, NSC888 evaluation board available.	NSC800-4	National	
x	x	x	x	x	Rockwell	Software compatible with NCR6502, 32 I/O lines, 16-bit counter	**NCR6500/1**	**NCR (1671)**	5
x	x	x	x	x	Rockwell	On-board UART, two 16-bit counters, 32 I/O lines.	**NCR6500/11**	**NCR (1671)**	
x	x	x	x	x	Rockwell	CMOS version of NCR6500/1 with bit manipulation instructions	**NCR65C00/1**	**NCR (1671)**	
x	x	x	x	x	GTE, Rockwell	CMOS NCR6502	**NCR65C02**	**NCR (1671)**	
x	x	x	x	x	Zilog	High speed, CMOS 8088	µPD70108-8	NEC	
x	x			x	Mostek, Zilog	Z80 compatible, 158 instructions, 8080A software compatible, 26 bytes R/W memory, on chip dynamic RAM refresh circuitry.	µPD780	NEC	10
x	x			x	Mostek, Zilog		µPD7800	NEC	
						48 I/O Lines, 12-bit programmable timer.	µPD7801	NEC	
						48 I/O lines, 12-bit programmable timer, bus expansion capabilities.	µPD7802	NEC	
						16-Bit Multiple/Divide, ROM bus, USART	µPD7807	NEC	
						16-Bit Multiple/Divide, ROM bus, USART	µPD7809	NEC	15
						16-Bit ALU, A/D Converter, USART	µPD7810	NEC	
						16-Bit ALU, A/D Converter, USART	µPD7811	NEC	
						ROM-less µPD78C06.	µPD78C05	NEC	
						46 I/O Lines, 8-bit timer.	µPD78C06	NEC	
						16-Bit Multiply/Divide, EPROM, USART	µPD78P09	NEC	20
x				x	AMD, Intel, Signetics, Siemens	Can be used with external RAM and ROM, 27 I/O lines, 8 bit interval timer/counter.	µPD8035L	NEC	
		x	x	x	Fujitsu, Intel, Signetics	Can be used with external RAM and ROM, 27 I/O lines, programmable, interval timer. Pin compatible with 8039.	µPD8039L	NEC	
x				x	AMD, Intel, Signetics, Siemens	27 I/O lines, 8 bit interval timer/events counter.	µPD8048	NEC	
		x	x	x	Fujitsu, Intel, Signetics	Same as PD8039L but with 2K ROM.	µPD8049	NEC	
x	x		x		AMD, Mitsubishi, Intel	8080A compatible.	µPD8085A-2	NEC	25
x		x	x	x	Intersil	CMOS version of PD8035L.	µPD80C35	NEC	
x			x		Intersil, Intel	CMOS version of PD8048.	µPD80C48	NEC	
x				x	AMD, Intel, Signetics, Siemens	Same as PD8048 but with 1K EPROM.	µPD8748	NEC	
x		x	x	x	NEC, National	CMOS version of MSM8035, low stand by power mode.	**MSM80C35**	**OKI (4732)**	
x		x	x	x	NEC, National	CMOS version of MSM8039, low standby power mode.	**MSM80C39**	**OKI (4732)**	30
x		x	x	x	NEC, National	CMOS version of MSM8048, low stand by power mode.	**MSM80C48**	**OKI (4732)**	
						CMOS version of MSM8085A.	**MSM80C85A**	**OKI (4732)**	
	x	x	x	x	Hughes		**CDP1802**	**RCA (1673)**	
x	x	x	x	x	Hughes		**CDP1802A**	**RCA (1673)**

MICROPROCESSOR–System Components

This section presents the major microprocessor system devices organized into system groups, ie 6800, 8080, 68000, etc. It includes those RAM's, ROM's and PROM's which are unique to a system. It omits most general purpose memories as they are listed in the Memory section. Similarly, buffers, line drivers, transceivers, UART's, etc. are covered briefly here as they are presented in depth in the Digital and Interface sections.

Bit Slice

Macrologic Bipolar

Function	Device	Source	Line
Buffer (16x4 First-in first-out memory. See also Memory-FIFO's)			
	9403AC	Fairchild	
	9403AM	† Fairchild	
	N9403	Signetics	
CRC Generator/Checker (See also Interface-Error Checking Circuits)	9401C	Fairchild	5
	9401M	† Fairchild	
	N9401	Signetics
